THE ARTS: ARCHITECTURE, SCULPTURE, PAINTING, MUSIC AND THE DANCE

THE SPIRIT OF INDIAN ART

NEARLY all the artistic remains of ancient India are of a religious nature, or were at least made for religious purposes. Secular art certainly existed, for literature shows that kings dwelt in sumptuous palaces, decorated with lovely wall-paintings and sculpture, though all these have vanished. Much has been said and written about Indian art since, some forty years ago, European taste began to doubt the established canons of the 19th century and looked to Asia and Africa for fresh æsthetic experience. Since then most authorities on the subject, Indian and European alike, have stressed the religious and mystical aspect of Indian art. While admitting the realism and earthiness of the earliest sculpture, most critics have read the truths of Vedānta or Buddhism into the artistic remains of our period, and have interpreted them as expressions of deep religious experience, sermons in stone on the oneness of all things in the Universal Spirit.¹

One student at least disagrees with this interpretation. There are indeed a few remains which seem imbued with an intensity of religious feeling rare in the art of the world, but it is the full and active life of the times which is chiefly reflected in the art of ancient India, at first directly, as at Bhārhut, Sāncī and Amarāvati, then with a gentle idealism, as at Ajantā, and finally in the multitude of figures, divine and human, carved on the many temples of the Middle Ages. In all these phases there is a *horror vacui* and an intense vitality which remind us rather of this world than the next, and suggest to us the warm bustle of the Indian city and the turbulent pullulation of the Indian forest.

Gothic architecture and sculpture are vertical. Spire and arch point upward, and as the style develops the spire becomes taller and the arch more pointed. The Christs, saints and angels of the Middle Ages in Europe are often disproportionately tall, and their tallness is accentuated by long garments reaching to the ankles. Their poses are generally restful, and they rarely smile. Medieval European art was truly religious; its conventions seem to have been

deliberately designed to lead the worshipper's thoughts away from the world of flesh to the things of the spirit. Much of it was the work of pious monks, or of men with deep religious vocations.

The tendency of Indian art is diametrically opposite to that of medieval Europe. The temple towers, though tall, are solidly based on earth. The ideal type is not abnormally tall, but rather short and stocky. Gods and demigods alike are young and handsome; their bodies are rounded and well-nourished, often by European standards rather effeminate. Occasionally they are depicted as grim or wrathful, but generally they smile, and sorrow is rarely portrayed. With the exception of the type of the dancing Śiva the sacred icon is always firmly grounded, either seated or with both feet flat on the ground. We need hardly mention that all Indian temple sculpture, Hindu, Buddhist and Jaina alike, made full use of the female form as a decorative motif, always scantily dressed, and nearly always in accordance with Indian standards of beauty.

Asceticism and self-denial in various forms are praised in much Indian religious literature, but the ascetics who appear in sculpture are usually well fed and cheerful. As an example we may cite the colossal rock-cut medieval image of the Jaina saint Gommateśvara (pl. LIX) at Śravaṇa Belgolā in Mysore. He stands bolt upright in the posture of meditation known as *kāyotsarga*, with feet firm on the earth, and arms held downwards but not touching the body, and he smiles faintly. The artist must have tried to express the soul almost set free from the trammels of matter, and about to leave for its final resting place of everlasting bliss at the top of the universe. Whatever the intentions of the artist, however, Gommateśvara is still an ordinary young man of his time, full of calm vitality. The saint is said to have stood for so long in meditation that creepers twined round his motionless legs, and these are shown in the sculpture; but, though intended to portray his sanctity, they do but emphasize that he is a creature of the earth whom the earth pulls back.

Ancient India's religious art differs strikingly from her religious literature. The latter is the work of men with vocations, brāhmaṇs, monks and ascetics. The former came chiefly from the hands of secular craftsmen, who, though they worked according to priestly instructions and increasingly rigid iconographical rules, loved the world they knew with an intensity which is usually to be seen behind the religious forms in which they expressed themselves. In our opinion the usual inspiration of Indian art is not so much a ceaseless quest for the Absolute as a delight in the world as the artist found it, a sensual vitality, and a feeling of growth and movement as regular and organic as the growth of living things upon earth.

THE EARLIEST ARCHITECTURE

Of the visual arts of ancient and medieval India much architecture and sculpture and a little painting have survived. As most of the existing sculpture was intended to be ancillary to architecture we deal with the latter first.

The utilitarian brick buildings of the Harappā Culture, strong and competent though they were, had apparently little æsthetic merit, and will not be mentioned here. With the exception of the walls of Rājagṛha (p. 198), which also have no artistic value, we have no significant architectural remains between the Harappā period and that of the Mauryas. This was due to the fact that few if any buildings were made of stone during this time.

Megasthenes mentions that the palace of Candragupta Maurya, though very large and luxurious, was built of carved and gilded wood, and the earliest stone buildings to have survived were evidently modelled on wooden originals. We must not assume, from the complete lack of material remains, that Indian building in the Mauryan period, or even before, was mean or primitive. The Mauryan monolithic columns prove that the craftsmen of those days had a thorough mastery of working in stone, and if the great cities of Mauryan times were built of wood we must attribute this chiefly to the comparative scarceness of stone in the Gangetic Plain and the abundance of timber where it is now scarce. There is no evidence of a cultural advance in the Middle Ages, when building in stone became common, but rather of a decline. The adoption of stone as a building medium was due partly to foreign contacts, but also to the gradual disappearance of timber forests from the more populous and civilized regions of India.

The wonderful Mauryan columns with their finely carved capitals fall rather under the head of sculpture than of architecture, for most of those which survive had no architectural purpose. Fragments of similar columns, found at Patnā, supported the roof of a palace, which has been reasonably identified as that of Aśoka. The remains of the Patnā pillared hall are so fragmentary that the plan of the building cannot be accurately reconstructed, but it was evidently a large one. At this time, however, stone buildings must still have been very rare. All the Mauryan pillars and other products of Mauryan stonemasons come from the same quarry, at Chunār, not far from Banāras, and all bear the stamp of the same school. They are the work of craftsmen who had learnt much from Persia, and perhaps a little from Greece, but had given their output distinctive Indian characteristics. Their workshops were probably maintained by the Mauryan kings, and

vanished with the dynasty. Working in stone had then to make a new beginning in India.

THE STŪPA

The stūpa began as an earthen burial mound, which was revered by the local population, and we have seen that the cult of stūpas was taken up by Buddhism, and that Aśoka raised stūpas in the Buddha's honour all over India (p. 263). Only one stūpa, in Nepāl, survives in the form in which the great emperor left it, but excavations of existing stūpas have shown the character of the earlier ones. They were large hemispherical domes, containing a central chamber, in which the relics of the Buddha were placed in a small casket, often beautifully carved in crystal. The core of the stūpa was of unburnt brick, and the outer face of burnt brick, covered with a thick layer of plaster. The stūpa was crowned by an umbrella of wood or stone, and was surrounded by a wooden fence enclosing a path for the ceremonial clockwise circumambulation (*pradakṣinā*), which was the chief form of reverence paid to the relics within it.*

In the period between the Mauryas and the Guptas much wealth and energy were spent on Buddhist architecture, and the older stūpas were greatly enlarged and beautified. Of these three are specially noteworthy—those at Bhārhut in Madhya Bhārat, Sānchī in the old Bhopāl state, and Amarāvati in the lower Kistnā Valley. The Bhārhut stūpa, perhaps in its present form dating from the middle of the 2nd century B.C., is important chiefly for its sculpture, and the stūpa itself has now vanished. That at Sānchī, on the other hand, is one of the most striking architectural remains of ancient India (pl. XIb).

In the 2nd century B.C. the old Sānchī stūpa was enlarged to twice its original size, becoming a hemisphere of about 120 feet in diameter. It was then faced with well-cut masonry laid in regular courses, and, besides the lower path on ground level, an upper terraced path some 16 feet from the ground was added. The old wooden railings were replaced by stone ones 9 feet high, tenoned and mortised in imitation of carpentry. Finally, towards the end of the 1st century B.C., four glorious gateways (torana) were added at the four cardinal points. Lesser stūpas and monastic buildings surrounded the great stūpa (fig. xviii).

The Sānchī gateways (pl. XXVII) are perhaps more noteworthy

* It has been suggested that the stūpa, like the later Hindu temple, was thought of as a microcosm of the universe. There are Mesopotamian precedents for this belief, and the passion for cosmic symbolism, evident in India from Vedic times, certainly led to the making of the analogy at least in respect of the temple.* But, though many authorities would disagree with us, we do not believe that cosmic symbolism played any great part in the thought of the ancient Indian architect.

for their carved ornamentation than their architecture. Each consists of two square columns, above which are three curved architraves supported by animals or dwarfs, the whole reaching some 34 feet above ground-level. The construction of these gateways, from the technical point of view, is primitive, and it has been suggested that their design is based on the log or bamboo portcullis of the ancient Indian village.³ The finish, on the other hand, is remarkably good, and the carvings are among the most fresh and vigorous products of the Indian sculptor (pl. XXVIII).

In respect of size few Indian stūpas greatly exceeded that of Sānchī, but in Ceylon the stūpa reached tremendous proportions. The Abhayagiri Dāgāba at Anurādhapura, the capital of the early

Fig. xviii.—Stūpas and Monasteries at Sānchī. (Reproduced from Percy Brown's "Indian Architecture (Buddhist and Hindu)", published by D. B. Taraporevala Sons & Co. Ltd., Bombay)

kings of Ceylon, was 327 feet in diameter, and larger than some of the pyramids of Egypt. It reached its present size, after a succession of enlargements, in the 2nd century A.D.

In India stūpa architecture became more and more ornate. The Stūpa of Amarāvati (fig. xix), which in its final form was completed c. 200 A.D., was larger than that of Sānchī, and its two promenades were adorned with carved panels (some of which can be seen in the British Museum) telling the story of the life of the Buddha. Meanwhile in Northern India stūpas grew taller in proportion to their bases. They were often set on square platforms, which in Burma and Indonesia were developed into stepped pyramids, the largest of which

is the enormous stūpa of Borobodūr, in Jāva, built in the 8th century A.D. Pinnacles became higher, and developed towards the spiring forms of the present-day temples of Burma and Siam.

Of later Indian stūpas the two most famous are those of Sārnāth and Nālandā. The tall stūpa of Sārnāth (pl. XIIa), near Banāras, the scene of the Buddha's first sermon, of which now little more than the inner core remains, was once a most imposing structure of beautifully patterned brickwork with a high cylindrical upper dome rising from a lower hemispherical one, and large images of the Buddha set in gable ends at the cardinal points. In its final form it dates from the Gupta period. The stūpa at Nālandā (pl. XIIb), seven times successively enlarged, in its present ruined state gives the

Fig. xix.—The Stūpa of Amarāvati. (Reproduced from Percy Brown's "Indian Architecture (Buddhist and Hindu)", published by D. B. Taraporevala Sons & Co. Ltd., Bombay)

impression of a brick pyramid with steps leading up to its terraces. It was originally a tall stūpa raised on a high base, with a smaller stūpa at each corner, but the monument underwent so many alterations in Gupta and Pāla times that it is now difficult for the untrained eye to recognize its original form at any one stage of its development.

Around the great stūpas were lesser ones, often containing the ashes of monks famous for their piety and learning, and a whole complex of buildings—monasteries, shrine-rooms, preaching halls and resthouses for pilgrims (fig. xviii). At the greater Buddhist sites such as Nālandā the groups of monastic buildings were often

surrounded by fortress-like walls. In their present partial dilapidation these heavy domes sometimes seem a little forbidding. Originally the limewashed or plastered stūpa shone brilliantly white in the tropical sunlight, its pinnacle, now generally broken, rising like a golden spear from the ceremonial stone umbrella on top of the dome. Then it must have given a different impression. The great Ruvanvāli Dāgāba at Anurādhapura in Ceylon, which in recent years has been restored and is once more used in Buddhist worship, rising white in the distance out of the plain, shows the stūpa at its best, as a worthy emblem of a great religion.

CAVE TEMPLES

Of the centuries before the Gupta period the chief architectural remains, other than stūpas and their surrounding gateways and railings, are artificial caves, excavated for religious purposes. Early specimens show a slavish imitation of carpentry which proves conclusively that the art of building in stone was still in its infancy. Thus two of the caves of Barābar Hill, near Gayā, dedicated by Aśoka to Ājīvika monks, are in the form of a plain rectangular outer hall, at one end of which is an inner chamber with a curved wall and overhanging eaves. The caves were evidently substituted for a standardized religious meeting place consisting of a round thatched hut standing in a courtyard, and their designer could not transcend the pattern to which he had been used. Similar dependence on wooden models is evident in many other features of design until the Gupta period.

The caves of the Barābar and Nāgārjunī Hills are quite unadorned, with the exception of one at Nāgārjunī, near Barābar, which has a comparatively simple carved entrance, added during or soon after the Mauryan period. The inner walls of all the caves are finely polished, no doubt by workmen of the school which was responsible for the polish of the Aśokan columns.

Late cave temples and monasteries are to be found in many parts of India, but it was in the Western Deccan, under the Sātavāhana Empire and its successors, that the largest and most famous artificial caves were excavated. The oldest Deccan cave, at Bhājā, near Poona, consists of a deep apsidal hall, cut in solid rock, with a row of plain octagonal pillars near the walls, which support curved ribs carved to represent the barrel vaulting of a wooden building. At the further end of the hall is a small stūpa, also cut from solid rock, and the outside of the cave has a façade, carved like a gable, with smaller ornamental gables on either side. Beside this cave, which was a meeting hall for Buddhist monks and lay worshippers, is a second cave

consisting of a broad cutting into the rock, leading to five cells, which were the dwellings of the monks.

From these beginnings the cave temples developed in size and splendour. The finest single example is the great caitya hall at Kārī (pl. XIII), probably made about the beginning of the Christian era. This is cut 124 feet deep into the rock, and is of the same general pattern as that at Bhājā and many other caves of the

Fig. xx.—Early Capitals. (Reproduced from Percy Brown's "Indian Architecture (Buddhist and Hindu)", published by D. B. Taraporevala Sons & Co. Ltd., Bombay)

Western Deccan, but much developed in size and splendour. The columns are no longer plain and austere, but, by a process which can be traced through earlier stages, they have become heavy and ornate. Each is set on a square stepped plinth, and rises from a bulbous base, which is carved to represent a large pot with base and rim; this is another survival of wooden construction, for the octagonal wooden pillars of earlier days were bedded in large earthenware pots

to protect them from ants and other insects. Each pillar carries a complicated group of horses and elephants with riders to support the roof, which is carved in imitation of the timber rafters of barrel vaulting. The caitya or shrine at the end of the hall is much enlarged in comparison with those of other caves.

The simple façades of the earlier caves were developed into elaborately carved verandas, usually with a large window, the full size of the gable-end, which let light into the hall (pl. XIVa). The Kārli cave has three fine entrances, and a frieze of relief sculpture on the lower levels, with small carved gable-ends above.

With the caitya halls the associated rock-cut monasteries or saṅghārāmas also developed in size and splendour. As a cave monastery became too small for its inhabitants a new cave was cut nearby and so the complex of caves grew over the centuries. The most famous of these cave groups is that of Ajantā, in the ~~north-west corner of Hyderābād~~. Here no less than twenty-seven caves, some 30 going 100 feet deep into the rock, were excavated in the horseshoe curve of a hillside, not far from the great trade route leading from the North to the Deccan (pl. XIV). The earliest caves date from the 2nd century B.C., while others are as late as the 7th century A.D. The splendid sculpture and lovely paintings with which they are adorned make them one of the most glorious monuments of India's past (p. 377f).

Perhaps even more impressive are the later cave temples of Ellorā, near Aurangābād, some thirty miles from Ajantā. Here are no less than thirty-four caves, constructed from the 5th to the 8th centuries A.D., most of them Hindu but some Buddhist and Jaina. The crowning achievement of Ellorā is the great Kailāsanātha Temple, excavated on the instructions of the Rāṣṭrakūṭa emperor Kṛṣṇa I (c. A.D. 756-773). With this the concept of the cave temple was transcended, for the king was not satisfied with a mere hollow in the rock. The entire rock face was cut away and a splendid temple carved like a statue from the hillside, complete with shrine-room, hall, gateway, votive pillars, lesser shrines and cloisters, the whole adorned with divine figures and scenes large and small of a grace and strength rarely seen again in Indian art (pl. XV). The ground plan of Kailāsanātha is of about the same size as the Parthenon, and it is half as high again. The labour necessary to construct it, however, was less than that which would be required to build a comparable temple of masonry, for transport created no problem, and the process of construction, beginning at the top of the cliff and working down to the base, avoided the need of scaffolding. But no considerations of this kind can disparage the glory of

Kailāsanātha, "the most stupendous single work of art executed in India".⁴

Kailāsanātha is not the earliest temple hewn from solid rock. Others are to be found at Māmallapuram, on the sea-coast some thirty miles south of Madras, where seventeen temples, none very large in size, were carved from outcropping hillocks of granite under the patronage of 7th century Pallava kings. The most famous of these, the "Seven Pagodas", still show the influence of wood construction, and are of a distinctive style, possibly looking back to Dravidian prototypes.

The latest cave-temples of importance are those of Elephanta, a beautiful little island off Bombay. These, in the same style as those of Ellorā, are famous for their sculpture, especially for the great Trimūrti figure of Śiva (p. 372). After these no important caves were excavated. Indians had long known the art of building in stone. The Kailāsanātha Temple, carved in exact imitation of masonry, showed the dissatisfaction with the older cave form. The great period of medieval temple building had begun.

TEMPLES

The earliest free-standing religious building of which traces remain is a small round hall, probably originally containing a Buddhist stūpa, at Bairāt near Jaipur; this dates from the 3rd century B.C., and was made of brick and wood; little but the foundations now exist, and the form had no future.

The next landmark in temple architecture is the temple generally known, from the modern name of the site, as that of Jandiāl, excavated from one of the mounds which covered the city of Takṣaśilā. This, one of the important buildings of the Greek city, contained a square inner sanctuary, a meeting hall and a courtyard, and its outer and inner entrances were each flanked by two large pillars of orthodox Ionian pattern. The Jandiāl temple was probably Zoroastrian, and had no direct successors, but the influence of Western architecture is clearly to be seen in Kashmīr, where columns of Hellenic type were used throughout the medieval period, in conjunction with distinctive pyramidal roofs and arches surmounted by pointed gables, which give the Kashmīr style an almost Gothic appearance. Most famous of Kashmīr's early temples is the Temple of the Sun at Mārtand, dating from the 8th century. There are no remains of free-standing Hindu temples erected before the Gupta period, though by this time they must long have been built in wood, clay and brick. From the Gupta period, however, several examples survive, chiefly in Western

India, all showing the same general pattern. Pillars were usually ornate, with heavy bell-shaped capitals surmounted by animal motifs, and the entrances were often carved with mythological scenes and figures. All the Gupta temples were small, and most had flat roofs. Their masonry was held together without mortar, and was far larger and thicker than was necessary for the comparatively small buildings. Evidently their builders had not yet fully mastered their technique, and were still thinking in terms of the cave. The finest Gupta temple, that of Deogarh near Jhānsī, probably of the 6th century, marks a great advance. Here iron dowels were used to hold the masonry together, and a small tower rose above the sanctum. The portal veranda was continued all round the building, making a covered walk.

The standard type of the Hindu temple, which has persisted from the 6th century to the present day, was not fundamentally different from that of the ancient Greeks. The heart of the temple was a small dark shrine-room (*garbhagrha*), containing the chief icon. This opened on a hall for worshippers (*maṇḍapa*), originally a separate building, but usually joined to the shrine-room by a vestibule (*antarāla*). The hall was approached by a porch (*ardhamāṇḍapa*). The shrine-room was generally surmounted by a tower, while lesser towers rose from other parts of the building. The whole was set in a rectangular courtyard, which might contain lesser shrines, and was often placed on a raised platform.

The medieval period in India was, like the Middle Ages in Europe, an age of faith. With better techniques of stone construction new temples sprang up everywhere to replace earlier wooden buildings, and kings and chiefs vied with one another in their foundation. Strict canons of design in both architecture and sculpture were laid down in textbooks (*śilpaśāstra*), some of which survive.⁵ The technique of architecture was not far advanced, despite the great achievements of the period. Though arches occur in the cave temples and in Kashmīr, the art of making a true arch, dome or vault, seems to have been ignored, although corbelling—the building up of an arch or dome by overlapping courses of brick or masonry—was widely practised, and produced work of great beauty. Mortar was known, but rarely used, for the style of archless and domeless architecture employed made it virtually unnecessary.

The temple was ornately decorated, often even to the dark shrine-rooms lighted only by flickering oil-lamps. Despite this ornateness the apprenticeship of his tradition in rock architecture gave the architect a strong sense of mass. Heavy cornices, strong pillars,

wide in proportion to their height, and the broad base of the *śikhara*, or tower, give to Indian temple architecture a feeling of strength and solidity, only in part counteracted by the delicately ornate friezes, and the many figures in high or low relief which often fill the whole surface of the temple wall.

Considering the size of the land, Indian temple architecture is remarkably uniform, but authorities distinguish two chief styles and numerous schools. The Northern or Indo-Āryan style prefers a tower with rounded top and curvilinear outline, while the tower of the Southern or Dravidian style is usually in the shape of a rectangular truncated pyramid. The stages of stylistic development are clearer in the South than in the North, where many ancient temples were destroyed by the Muslim invaders. We therefore consider the styles of the Peninsula first.

Temple building gained much from the patronage of the Pallava and Cālukya kings in the 6th–8th centuries. Important early temples of the former dynasty are to be found at Māmallapuram, already referred to (p. 355), and Kāñcī, while the Cālukyas left temple remains at their capital Bādāmi, and the nearby site of Aihole, both in Hyderābād. Both styles show the gradual emancipation of the architect from the techniques of carpentry and cave architecture. The apogee of the Pallava style was reached in the Shore Temple at Māmallapuram (pl. XVIa) and the Kailāsanātha Temple of Kāñcī, built early in the 8th century. The latter has a pyramidal tower formed of two courses of small barrel vaults, surmounted by a solid cupola suggesting a Buddhist stūpa.

The style of the Pallavas was developed further under the Cōla dynasty (10th–12th centuries), the finest products of which are the great temple of Śiva at Tanjore, built by Rājarāja the Great (985–1014), and the temple built by his successor, Rājendra I, at his new capital of Gaṅgaikōṇḍacōlapuram, near Kumbakonam. The former was probably the largest temple built in India up to that time; the comparatively modest tower of the Pallava style was replaced by a great pyramid, rising from a tall upright base and crowned with a domed finial, the whole being nearly 200 feet high. This set the style of the Dravidian śikhara, which has continued with some variation down to the present day. Both these temples contain elaborate pillared halls and beautiful decoration.

In the next phase of Dravidian architecture the emphasis shifted from the tower above the chief shrine to the entrance gateway of the surrounding wall. Though there are a few records of the desecration of temples by hostile sectarians or invaders, it is difficult to find a practical reason for the growing custom of surrounding South Indian

temples with strong and high walls, unless this was done in imitation of the palaces of kings, with which the temples had much in common. From the 12th century onwards it became usual to fortify the temple, often with three square concentric walls, with gates on the four sides. The gates were surmounted by watch-towers or gatehouses, and these developed into soaring towers (*gopuram*), generally much taller than the modest śikhara over the central shrine. The entrance tower was usually in the form of an oblong pyramid, with its broadest side parallel to the wall (pl. XIXa). The new style is often called Pāṇḍyan, from the name of the dynasty which supplanted the Cōḷas in the Tamil country, and the kings of which were responsible for building walls and gateway towers round many existing shrines. The style introduced more elaborate ornamentation, and the use of animal forms in pilasters and columns, including the rampant horses and leogryphs which give a distinctive character to late Dravidian architecture.

The culmination of the Pāṇḍyan style lies in the mighty temple complexes of Madurai, Śrīraṅgam, and elsewhere, which are strictly outside our period, belonging in their present form to the 17th century. The great temple of Madurai is the most famous and beautiful of these (pl. XIXb), but the largest is the Vaiṣṇavite temple of Śrīraṅgam (fig. xv, p. 201), which is contained in an outer wall measuring 2,475 by 2,880 feet, and has six inner walls, all with gopurams, surrounding a shrine of comparatively modest proportions. These later towers were covered with sculptured figures.

While these developments were taking place in the Tamil country, other styles developed in the Deccan, under the Cālukyas, Rāṣṭrakūṭas and Hoysaḷas. The earliest Cālukyan temples closely resemble the Guptan in style. By the 8th century they had developed individual features, including the wide overhanging eaves which became characteristic of the medieval temples of the Central Deccan. The later Cālukyas and Hoysaḷas (11th–14th centuries) developed a more elaborate style. Their temples were no longer built on a rectangular plan, but were polygonal or stellate, raised on a tall solid platform of the same shape as the building. These temples give a strong feeling of flatness, for platforms and walls alike are covered with rather narrow carved friezes of elephants, horsemen, geese, monsters (*yāli*), and scenes of mythology and legend (pl. XVII). The grotesque mask (*kīrtimukha*) * became very common as a decorative

* The *kīrtimukha* is found in other South Indian schools as a decorative motif, especially in the *makara-toraṇa*, a gateway with a large *kīrtimukha* mask above the lintel connected by foliate designs to two *makaras* or sea-monsters at the base of the doorposts. These motifs were exported to South-East Asia and became regular features of Indonesian and Cambodian architecture.

feature, and turned columns, often ornately carved, were widely used. The largest and most famous temples of this style, at Halebīd (Dōrasamudra, the Hoysaḷa capital) and Bēlūr, have no towers, and it is thought that they were not completed. Some smaller temples of the same period have towers, notably the charming temple of Somnāthpur (pl. XVIb), which has three low dome-like śikhara, their breadth emphasized by parallel mouldings. Its profusion of pillars, and its abhorrence not only of blank spaces but even of plane surfaces and straight lines, tend to give this style an impression of wedding-cake prettiness, despite the solid proportions of its masonry and the brilliance of its sculptured decoration.

The school which flourished under the Vijayanagara empire, and reached its apogee in the 16th century, shows both Pāṇḍyan and Hoysaḷa features. The florid carving of the Hoysaḷas was developed with even greater exuberance, and new elements appeared in the temple complex. As well as the main shrine every important temple in South India was provided with a shrine for the *ammaṇ*, the god's chief wife, which was often nearly as large as the main shrine itself, and a marriage-hall (*kalyāṇamaṇḍapam*), wherein the icons of god and goddess were ceremonially united on festival days. Another feature of the Vijayanagara style is the profusion of strong yet delicate carving which adorns the pillared halls, the many columns of which are so decorated that they become sculptures in their own right. Prancing horses, vigorous and energetic, leap from the stone (pl. XVIIIc), with leogryphs and other fantastic monsters. For brilliancy of decorative imagination the Vijayanagara style of architecture was never surpassed in Hindu India. Its finest production is undoubtedly the Viṭṭhala Temple at Hampī, the old Vijayanagara.

In the chief cities of Northern India almost all traces of the architecture of the Hindu period have vanished. Even in holy Banāras all the great and famous temples are comparatively recent. One important exception, however, is the Buddhist temple at Gayā (pl. XXa) the main tower of which is probably as early as the 6th century. This is a large pyramid of brickwork, set on a high plinth; it is adorned with parallel courses of "caitya window" pattern and is surmounted by a lofty pinnacle which was originally a small stūpa. Similar towers existed in other Buddhist monastic establishments, but have long since vanished. The Gayā tower suggests rather the Southern than the Northern style of śikhara, but other temples of the period either have no towers or have small curvilinear ones which are evidently the prototypes of the later Northern śikhara.

Medieval North Indian architecture is best illustrated by three

schools—those of Orissā, Bundelkhand, and Gujarāt and South Rājasthān. There were other local developments, as well as the distinctive style of Kashmīr which we have already noted, but these three are certainly the most important, and their products are the best preserved.

The Orissan school flourished from the 10th to the 13th centuries, and its chief monuments lie in and around the towns of Bhubanesar and Purī. The finest Orissan temple is the Liṅgarāja at Bhubanesar (pl. XXb, fig. xxi), which shows the North Indian śikhara in its final form—a tower which begins to curve inwards at about one third of its height, with rounded top crowned by a flat stone disc (*amalaka*)

Fig. xxi.—Liṅgarāja Temple, Bhubanesar, Orissā. (Reproduced from Percy Brown's "Indian Architecture (Buddhist and Hindu)", published by D. B. Taraporevala Sons & Co. Ltd., Bombay)

and a finial (*kalaśa*). The upward movement of this graceful curving tower is emphasized by deep vertical inlets, but its solidity and firm basis on earth are very evident. The Liṅgarāja, like most Orissan temples, is built as a series of four halls—a hall of offerings, a dancing hall, an assembly hall and a sanctuary.* The sanctuary is crowned by the great tower, but the other three elements of the temple, leading one by one to the shrine, are also roofed with characteristic towers of smaller size, carrying the eye to the main śikhara. The whole temple enclosure of the Liṅgarāja is filled with smaller shrines, built on the pattern of the great one.

* Often referred to by the modern vernacular names, *bhog maṇḍir*, *nāṭ maṇḍir*, *jag-mohan*, and *deul* respectively.

pārvaṭī or Uṃā, the Wife of Śiva. (Part of the same piece as plate LXVIII).

Kālī, the Stermer form of Pārvaṭī. Bronze. Cōla.

Kālī as Demoness playing Cymbals. Bronze. Cōla.

The Orissan architects were lavish with their exterior decoration, and their sculptors produced works of great merit, but the interiors of their temples are unadorned. In the larger temples the corbelled roofs of the halls rested on four large pilasters, but pillars were not generally used, and roofs were often partly supported by iron girders, a striking technical innovation.⁶

Among the most important Orissan temples are the Temple of Viṣṇu-Jagannātha at Purī, still one of the most famous shrines of India, and the "Black Pagoda" of Konārak, built in the 13th century. The latter, a temple of Sūrya, the sun-god, was formerly one of the largest and most splendid temples of India, much larger than those

Fig. xxii.—Temple of the Sun, Konārak, Orissā. (Reproduced from Percy Brown's "Indian Architecture (Buddhist and Hindu)", published by D. B. Taraporevala Sons & Co. Ltd., Bombay)

of Bhubanesar (fig. xxii). The tower, over 200 feet high, has long since fallen, but the great assembly-hall remains. Unlike the other temples of this region that of Konārak had the two smaller outer halls completely separate from the main structure, and assembly-hall and tower were built on an imposing platform, round which were carved twelve decorated wheels, 10 feet in diameter (pl. XXI*a*). The entrance is reached by a broad flight of steps, flanked on either side by prancing horses, the whole representing the chariot in which the sun-god rides across the heavens. The court of the temple was decorated with large free-standing sculptures of great strength and beauty (pls. LVII–III). The exceptionally frank eroticism of many

of the Konārak sculptures has given the "Black Pagoda" a rather infamous reputation. *Maithuna* figures, of couples closely embracing or actually *in coitu*, are common enough as decorative features of many Indian temples, but those of Konārak are exceptionally vivid. Many suggestions have been made as to the true significance of these figures; it has been suggested that they merely served the mundane purpose of advertising the charms of the devadāsīs, or temple prostitutes,⁷ or that they were intended to represent the world of the flesh, in contrast to the bare and austere interior, which symbolized the things of the spirit; probably they were connected, in the minds of their designers, with the sexual mysticism which played so great a part in medieval Indian religious thought.⁸ No doubt the temple of Konārak was a centre of a flourishing tantric cult.⁹

Under the Candella kings of Bundelkhand a great school of architecture flourished in the 10th and 11th centuries, the chief work of which is a beautiful group of temples at Khajurāho, about 100 miles south-east of Jhānsī. These temples are built on a rather different plan from those of Orissā, and are not very large, the finest, a Śaivite temple known as Kandāriya-Mahādeo, was built about A.D. 1000, and is not more than 100 feet high. The standard type of Khajurāho temple contains a shrine-room or sanctuary, an assembly-hall, and an entrance portico. Whereas in the Orissan temple these elements were conceived rather as separate entities joined together by vestibules, the Khajurāho architects treated them as a whole, and though each part has its own roof they are not structurally separate. The Khajurāho śikhara, like those of most Northern temples, is curvilinear (pl. XXc), but differs from the type of Orissā. It is curved for its whole length, and its upward thrust is accentuated by miniature śikharas emerging from the central tower. The crowning discs of these projections break the upward movement, and remind the observer that the divine is to be found on earth as well as in heaven. The effect of the whole, despite its symmetry, is one of organic and natural growth. The tower, and indeed the whole temple, seems intimately at one with the earth, suggesting an enormous ant-hill, or a high peak surrounded by lesser mountains. Though expressed in the most baroque of styles, the Kandāriya-Mahādeo is a striking instance of a feature common in much Indian art, a feeling of unity with nature.

The halls and porticoes of the Khajurāho temples are also crowned with smaller towers, which rise progressively to lead the eye up to the main tower, and thus intensify the impression of a mountain range. While the Orissan roof is pyramidal in pattern, the Khajurāho builders employed corbelling to produce the effect of a flattish

dome. The mass of the buildings is broken by pillared window openings, which relieve the monotony of the ornately carved stone. A further distinctive feature of the style was the introduction of small transepts to the assembly hall, giving the whole a ground-plan not unlike that of a Gothic cathedral.

Like all other schools of architecture, that of Khajurāho made much use of carving. Here, in contrast to Orissā, the temples were adorned with sculpture both outside and in, and the halls have beautifully carved domical ceilings. The style of Khajurāho sculpture lacks the solidity and vigour of the best of Orissā, but the wonderful friezes of statuary contain figures of a graceful vitality, warmer and more immediately attractive than those of the Orissan temples (pls. XLVI–VIII).

In Rājasthān and Gujarāt are many medieval temples, some of much architectural merit. Here we can only mention the greatest of these Western schools, that which rose under the patronage of the Caulukya or Solāṅki kings of Gujarāt, and flourished from the 11th to the 13th centuries. This kingdom was wealthy from the sea-borne trade with the Arabs and Persians, and much of the treasure of kings, ministers and merchants alike was expended on beautiful Jaina and Hindu temples.

The most famous buildings of this school are the lovely Jaina shrines of Mount Ābū, the style of which is not very different fundamentally from that of Khajurāho. The temples were built on high platforms and usually consisted of a shrine and hall only, without an entrance portico. The śikhara over the shrine, like those of Khajurāho, was adorned with a large number of miniature towers, and the ceilings were in the form of corbelled domes. Perhaps through the influence of Muslim architectural styles, these ceilings were carved so as to give the impression of a true dome, the steps of the corbelling being skilfully concealed by the sculptor, and the flat crossbeams, supported on pillars, often being adorned with large brackets meeting at the centre, which gave an arch-like effect, though the true arch was never employed. The most outstanding feature of this style was its minute and lovely decorativeness (pls. XXIc, XXII). The shrines of Mount Ābū, made of cool white marble, are covered with the most delicate and ornate carving, especially in the interiors: it is, however, rather flaccid and repetitive. In comparison with Bhubanesar, Konārak and Khajurāho the rich decoration of Mount Ābū has a flavour of cold lifelessness.

Remains of pre-Muslim secular buildings are few. In the Middle Ages kings and chiefs certainly built stone palaces, but of these only the base of the Vijayanagara throne-room, and some remains in

Ceylon, have survived. Several cities of Rājasthān and Gujarāt have finely carved gateways from the medieval period (pl. XXIb). But, though secular architecture was no doubt highly developed, it is clear that India's architects and masons devoted their greatest energies to temple building. Working according to strict traditions, but showing much ingenuity and originality within the main standardized pattern, they erected monuments of fantastic beauty with the simplest technical equipment. Many patient hands reared the śikhara above the plain, and capped them with great slabs of stone, raised on enormous ramps of earth, like the higher courses of the pyramids of Egypt. Whether or not the architects and craftsmen were conscious of the symbolism, the temple was looked on by some as a microcosm of the world, as the open air sacrifice had been in earlier days. In sculpture, and often in painting also, all the gods were depicted on its walls, every aspect of divine and human existence symbolized. Like Hindu civilization itself, the temple was at once voluptuous and austere, rooted in earth, but aspiring to heaven.

SCULPTURE

In architecture there is no real trace of relationship between the brick houses of Harappā and the stone temples of Hindu India, and the art of building in stone seems to have been learnt slowly from the time of Mauryas onwards. The earliest sculpture of historical times, on the other hand, shows a generic likeness to that of Harappā, which we have already described (p. 20f). From the end of the Indus cities to the rise of the Mauryas over a millennium elapsed, with no surviving work of art to fill it. Somewhere in North India the art of sculpture, no doubt in perishable materials, was certainly kept alive. The patronage of the Mauryan emperors, the influx of western influence, and growing material prosperity, led to its revival, and to the making of stone figures and reliefs which have survived to this day.

The capitals of Aśoka's columns, some of which were perhaps made before his reign, are the earliest important sculptures after those of the Indus cities. They are not characteristic of Indian sculpture, though they contain many native features. The famous lions of the Sārnāth column and the less famous but more beautiful bull of the column of Rāmpūrvā (pl. XXIIIa) are the work of realistic sculptors, owing something to Iranian and Hellenist tradition. Yet, if we did not know that the possibility of Western influence existed, we might suggest that the animal sculptures of the columns were those of a school directly descended from the engravers of the Indus seals,

which also show a realistic treatment very unusual for so early a civilization. The abaci of the capitals perhaps show native influence more clearly than the crowning figures, and bear animals in lively postures, wheels, representing both the Buddha and the Mauryan World-emperor, and floral and foliate designs in which typical Indian motifs appear side by side with some borrowed from the West. Other than the pillars there are few remains of the Mauryan school, with its high polish and fine finish. One beautiful figure, the "Dīdārganj Yakṣī" (pl. XXVIa), bears the distinctive brilliant polish of the school, but the treatment of the figure suggests that it is post-Mauryan. The yakṣī bears a *caurī*, or ceremonial yak's tail fly-whisk with which kings and gods were fanned; this shows that the figure was made as the attendant on another figure or a sacred object, which has now vanished.

A number of figures of yakṣas, somewhat larger than life-size, are the only other important free sculptures of the centuries immediately before Christ. They are strong, bull-necked and heavy, and, though not technically perfect, have an elemental solidity rarely found in later sculpture. The treatment of the ample abdomens of these figures has been compared with that of the abdomen of the Harappā torso and gives further evidence of the survival of tradition over the long intervening period.

The most important sculptural remains of the post-Mauryan period are the carvings on the rails and gateways of the great Buddhist sites at Bhārhut, Gayā and Sānchī. There is no absolute certainty about the dating of these remains, but the sculpture of Bhārhut is in a less highly developed style than that of Gayā and Sānchī, and is probably the earliest, while the gateways of Sānchī, carved with great sureness and skill, are probably the latest of the three. The series Bhārhut-Gayā-Sānchī is to some extent confirmed by epigraphic evidence, and we may date Bhārhut c. 150 B.C. and Sānchī about the end of the 1st century B.C., with Gayā somewhere between the two. The criteria are not, however, absolutely certain, for it is possible that the backward and advanced schools were approximately contemporary.

At Bhārhut (pls. XXIII-V) the upright posts of the stūpa railings are carved with yakṣas and yakṣīs, beautifully finished and very decorative, like all the best Indian sculpture, but archaic and uncertain in treatment. Their flatness suggests that the artists were trained in the working of ivory, and were laboriously learning to translate their skill into a different medium. The medallions of the crosspieces (pl. XXIIIc-e), mostly depicting scenes from Jātaka stories, have a similar archaic flavour.

The Gayā railing, enclosing not a stūpa but the sacred path where the Buddha walked in meditation after he had obtained enlightenment, shows an advance on Bhārhut. The figures are deeper, more vital, and more rounded, and the sculptors had by this time evidently gained greater mastery of their technique. Figures are no longer always carved flat on the stone, but begin to appear in three-quarter poses. Notable at Gayā are the medallions containing human heads, which have such realism that they may well be portraits.

The crowning achievement of early North Indian sculpture is undoubtedly Sāncī. Here a smaller stūpa (Stūpa II) is adorned with carvings of very archaic character, according to some authorities older than those of Bhārhut. The railings of the main stūpa are quite unadorned, but, in sharp contrast, the great gateways are carved with a multitude of figures and reliefs. From top to bottom and on all sides the massive square uprights and triple architraves are alive with the life of the times. Yakṣīs smile as they lean in easy graceful poses,* or serve as brackets to the architraves (pl. XXVIIb), which are supported by massive elephants or cheerfully grinning dwarfs. The flat surfaces of the uprights and architraves are covered with panels depicting scenes from the life of the Buddha or from Jātaka stories (pl. XXVIII). Cities are besieged, riders on elephants and horses pass in procession, men and women worship sacred shrines, elephants roam the jungle; lions, peacocks, yakṣīs, nāgas, mythical animals and ornate floral designs fill the whole. Some of the motifs are evidently of Mesopotamian or Persian inspiration, but the whole is typically Indian in its complexity of pattern, its cheerful busy realism, and its exuberance.

The carvings of the Sāncī gateways were not carried out according to any preconceived scheme. The sculptors were not commissioned by the monastery, but by private patrons, who wished to gain merit by beautifying the stūpa, and they carved what their patrons told them in the way they thought best. Superficially the result was lacking in formal unity, but was endowed with a unity transcending rule and pattern, the unity of a prosperous culture, pious in devotion to its shrines, and delighting in the world it lived in and knew. The visitor, standing on the hill of Sāncī on a sunny winter day, when the wild peacocks walk among the ruins and the great plain shimmers in the hazy distance, gets the overriding impression that this is the work of a happy people at one with itself.

Technically the carvings are of high excellence. The sculptors

* The *tribhaṅga*, a pose in dancing and dramatics with one leg bent and the body slightly turned at the hips, was a favourite with the sculptor from the earliest times. It contrasts sharply with the hieratic poses of most ancient art other than that of the Greeks, and gives an impression of life and vitality.

have now fully mastered their material. Their treatment, while not, of course, realistic in the nineteenth-century sense, has transcended the rather stiff formalism of Bhārhut, and is free and alive. The sculpture of Sāñchī everywhere gives a sense of certainty; the artists knew what they had to depict, and clearly saw in their mind's eye how to do so.

At Bhārhut, Gayā and Sāñchī, and indeed in all the Buddhist sculpture of this period, the Buddha himself is never shown, but symbolized by such emblems as a wheel, an empty throne, a pair of footprints or a pīpal tree (pl. XXVIII). The obvious reason for this iconographical peculiarity is that he was so venerated that it seemed sacrilegious to portray him, but we have no literary or other evidence to confirm this. The aversion to depicting the Buddha may have been due to the fact that, since he had passed quite out of the universe, it was thought misleading to show him in human form. In any case the familiar Buddha image of later times is not to be found at these three early Buddhist sites. The schools of Gandhāra (the lower Kābul Valley and the upper Indus, around Peshāwar) and Mathurā, both of which flourished under the Kuṣāṇa kings, vie for the honour of having produced the first images of the Buddha. Most Indian authorities now believe that the Buddha image originated at Mathurā; most earlier Europeans supported Gandhāra, but some recent experts are less certain.

The school of Mathurā probably began at the end of the 1st century B.C., though some authorities would date it later. Working for centuries in the white-spotted red sandstone of the locality, it produced works which were carried far and wide, and had much influence on later sculpture. Some of the school's inspiration was Jaina, and at an early period the Mathurā craftsmen were making votive plaques depicting the cross-legged naked figure of a Tīrthaṅkara in meditation, which may have inspired the Buddhists to depict their own teacher. Perhaps the most striking remains of the Mathurā school are the yaksīs from the railings of a stūpa, which was probably Jaina. (pl. XXIXa). These richly jewelled ladies, their figures exaggeratedly broad of hip and slender of waist, stand in pert attitudes reminiscent of the Indus dancing-girl (pl. VIIIb), and their gay and frank sensuality in a context of piety and renunciation gives another example of the remarkable antinomy of the ancient Indian outlook on life, which found nothing incongruous in such a juxtaposition.

Rather outside the main range of Mathurā art are the Kuṣāṇa royal statues, most of which were found at the nearby village of Māt, where the kings no doubt had a winter residence, with a chapel in which the memory of former monarchs was revered. The figures have

nearly all been broken by succeeding rulers, and that of the great Kaniṣka, the most striking of the statues, unfortunately lacks its head (pl. XXXa). Wearing the dress of Central Asia, a long coat and quilted boots, and grasping in one hand a sword and in the other its sheath, the king stands with legs apart, in an attitude of authority. This statue may be criticized technically as showing no sense of depth, being virtually in two dimensions. The sculptor was evidently working on a theme to which he was not used, but he succeeded in producing a work of much power, suggesting the hieratic royal statues of Egypt.

The early Buddhas and Bodhisattvas of the Mathurā school are happy fleshy figures with little spirituality about them, but later they developed in grace and religious feeling (pl. XXXVib). Though the Mathurā school owed much to earlier Indian tradition, it also borrowed from the North-West, and adopted more than one Greco-Roman motif. Through Mathurā the style generally known as Gupta developed, and produced some of the greatest Indian religious sculpture.

The school of Gandhāra was evidently influenced by the art of the Roman Empire, and some of its craftsmen may have been Westerners. Though often called Greco-Buddhist, the Greek kingdoms of Bactria and N.-W. India had long vanished when this school emerged. It is not to the Greco-Bactrian heirs of Alexander, but to the trade with the West, encouraged by the rising prosperity of Rome and the eastwards march of her legions, that we must attribute this syncretistic school. The Greeks left only a few lovely silver articles, beautiful coins, and one or two other objects, perhaps imported from the West. It was Kaniṣka and his successors and their wealthy subjects who gave to the school of Gandhāra the encouragement and support through which it flourished. The new devotional Buddhism demanded iconic worship, and figures of the Buddha and Bodhisattvas were produced in large numbers, as well as small votive plaques depicting scenes from the Buddha's life or Jātaka stories (pl. XXXIII).

The Mathurā sculptors drew inspiration for their Buddha images from the burly yakṣa figures of the earlier centuries on the one hand and from the meditating Jaina Tīrthaṅkara on the other. The Gandhāra sculptors had other models in the gods of the Greco-Roman World. Often their inspiration seems almost wholly Western (pl. XXXI), and it is hard not to believe that some of the Gandhāra masters were foreigners from Syria or Alexandria. The school has depreciated in recent years. When all art was judged by classical norms it was thought to be the finest school of Indian art, which once and once only produced work of grace and realism. Now the sculpture of

Gandhāra is sometimes described as a mere imitation of an imitation, the weak copy of a great art in decline. Neither judgement is fair. In an Indian context the style of Gandhāra has a rather insipid flavour, but it is not without originality. The Buddhas of Gandhāra, though perhaps lacking in the spirituality of those of the Gupta period, are gentle, graceful and compassionate, while some of the plaques are vivid and energetic. The school continued after the great Kuṣāṇas, though with less prosperous times it produced few works in stone, but many in plaster or stucco. Its influence was felt far beyond the bounds of India, and can be traced even in China.

While these schools were developing in the North others appeared in the Peninsula. Here, in the Bhājā cave (p. 353) and at Udayagiri in Orissā, very ancient sculpture is to be found, possibly no later than that of Bhārhut. The great Buddhist cave temples of the Western Deccan contain much sculpture of great merit, perhaps the finest of which are the numerous figures of donors, often carved in high relief on the cave walls. These are frequently in couples, their arms on one another's shoulders, and seem to be idealized portraits of the wealthy patrons of the Buddhist caves (pl. XXXIV). Such couples are also to be found in early terracottas (pl. LXIIb), and no doubt their originals believed that by placing their effigies in shrines they would obtain both material and spiritual benefits. It may be that these are the forerunners of the *maithuna* couples of the medieval temples (p. 362), but the spirit behind the early *dampatī* pairs seems very different, for these figures have no overt sexual significance. The man usually looks not at his wife but outwards into the hall, while the woman glances downwards, and, quite unlike the bold yakṣīs of the North, holds her body diffidently, almost timidly, as if rather embarrassed at being stared at in public. We believe that these figures represent the ideals of ancient Indian married life, and are no more esoteric than the family memorial brasses in many English churches.

The region between the lower valleys of the Kistnā and Godāvārī became an important centre of Buddhism at least as early as the 2nd century B.C., and some very ancient sculpture in low relief, intended to adorn the sides of stūpas, is to be found there. This already shows the characteristic elongation of the mature style of Amarāvātī. In the late Sātavāhana period (2nd–3rd century A.D.) the great stūpa of Amarāvātī was adorned with limestone reliefs depicting scenes of the Buddha's life and surrounded with free-standing Buddha figures. The relief medallions are certainly among the greatest works of Indian art (pl. XXXV). Beautifully balanced in composition to fit the circular frames, they convey an intense vitality and sense of rapid movement, quite unexpected in the context of the grave and calm

religion they illustrate. The slender, long-legged figures are portrayed in vigorous action, often rising almost to frenzy, as in the famous medallion showing a host of ecstatic demigods carrying the Buddha's begging-bowl to heaven. The Amarāvātī school had great influence. Its products were carried to Ceylon and South-East Asia and had a marked effect on local styles, while its influence on later South Indian sculpture is also very evident. ~

Meanwhile in the North the Śāka and Kuṣāṇa invaders had in part retreated and in part merged with the indigenous population, to make way for the great Gupta empire. From the point of view of art the Gupta Period is generally taken to include at least the 4th–6th centuries and the first half of the 7th. The plastic remains of this age are comparatively few, but enough survive to show the achievement of the time. If the schools of Bhārhut, Sāñchī and Mathurā are marked by a sensual earthiness, and that of Amarāvātī by vital, excited movement, the Guptan sculpture suggests serenity, security and certainty. It was at this time that India produced some of her most truly religious art, especially in the lovely Buddhas of Sārnāth. Most famous of these is the icon of the Buddha “turning the Wheel of the Law”, or preaching his first sermon (pl. XXXVIa), which, more than any other Indian sculpture, seems to convey the true message of Buddhism. Surrounded by a large and ornate halo, flanked by two small demigods, the Master sits majestically, his body slender and rounded, plastically so simplified that no trace of muscular contour can be seen, his delicate fingers forming the *dharmacakra mudrā*, which indicates that he is preaching. His face is, as usual, that of a young man, with delicately modelled lips; his half-closed eyes and slight smile tell more graphically and vividly than any of the rather dry Buddhist scriptures his fundamental message, and emphasize not its first part, that the world is full of sorrow, death and decay, but that it is possible to transcend these evils, and reach a state where age and grief no longer affect the mind, and where earthly pleasure is transmuted into serene inner joy.

This great masterpiece, however, illustrates only one aspect of Gupta art. In the region of Gwālīor and Jhānsī an excellent school of Hindu sculptors existed, and the carvings of the temple of Deogarh, depicting Hindu gods and mythological scenes, show the beginnings of the early medieval style. The splendid figure of the sun-god Sūrya from Gwālīor (pl. XXXVIIa) illustrates another aspect of the outlook of the times. Broad and sturdy, cheerfully smiling, the god looks straight ahead at his worshippers, his right hand raised in blessing—the god of a good-natured, happy people. Equally significant of the spirit of the Gupta Period, if less perfect

in execution, is the charming relief of a dancer, accompanied by girl-musicians, found at Pāwayā, near Gwālior (pl. XXXVIIb). Another famous Guptan sculpture is the "Sānchi Torso",* the delicately but vigorously modelled body of a Bodhisattva, its smooth contours emphasized by the minutely carved jewelled collar and belt and the scarf of antelope skin hanging over the left shoulder (pl. XXXVIII).

Perhaps the most immediately impressive of all Guptan sculpture is the Great Boar, carved in relief at the entrance of a cave at Udayagiri, near Bhilsā (pl. XXXVIIc). The body of the god Viṣṇu, who became a mighty boar to rescue the earth from the cosmic ocean (p. 302), conveys the impression of a great primeval power working for good against the forces of chaos and destruction, and bears a message of hope, strength and assurance. The greatness of the god in comparison with his creation is brought out by the tiny female figure of the personified earth, clinging to his tusk. The deep feeling which inspired the carving of this figure makes it perhaps the only theriomorphic image in the world's art which conveys a truly religious message to modern man.

Sculptures of the medieval period are so numerous that they cannot be discussed here in detail. By this time iconographical canons were fixed. Every god had his special attributes, which were regularly portrayed in his image; the proportions of body, limbs and features were laid down, and were adhered to with increasing rigidity; but the Indian sculptor succeeded in producing remarkable variety in his now almost hieratic art.

Under the Pāla and Sena kings of Bihār and Bengal (8th-12th centuries) both Buddhists and Hindus made fine icons, much of it in local black stone. The special characteristic of Pāla art is its fine finish; its figures are much decorated and well polished, and often seem rather made of metal than of stone (pl. XLV).

The sculpture of Orissā was greater than that of the Pālas. The carvings of the temples of Bhubanesar and Konārak (pls. LIV-VIII) show a deep sensuous appreciation of the human form and an expressiveness which gives them a characteristic beauty of their own. The finest Orissan sculptures are those in the courtyard of the Temple of the Sun at Konārak, where the forceful horses (pl. LVIII) and the mighty elephant crushing a malefactor in his trunk (pl. LVII) show a strength of treatment and a feeling for animal form rare in the world's art, and reminiscent of the animal sculpture and ceramics of the T'ang dynasty of China.

The Khajurāho temples are covered with figures of divinities and pairs of lovers of wonderful delicacy and grace (pls. XLVI-VIII), and

* Said by some to be an exceptional Pāla production.¹⁰

in many other parts of North India many works of beauty survive, although few can vie with those of Orissā.

In the Deccan individual schools of sculpture appeared. The temples of Aiholē and Bādāmi contain fine work of the 5th century onwards (pl. XL), which shows the influence of the Guptan style, with a tendency to elongation perhaps inherited from Amarāvati. More important are the sculptures of Māmallapuram, adorning the wonderful complex of rock-temples made by the Pallava kings of Kāncī. Most striking of these sculptures is the great relief of the descent of the Ganges (pl. XLI), covering a rock face over 80 feet long and nearly 30 feet high. A natural cleft in the rock has been utilized to represent the Sacred River, who is watched on either side by gods, demigods, ascetics and elephants, as she descends from the head of Śiva, and who has sinuous snake-spirits (*nāgas*) swimming in her waters. The artists who designed this splendid relief had a sardonic sense of humour, for among the worshipping ascetics they carved the crafty cat, who performed penance in order to lure the mice to their doom. Māmallapuram contains other fine relief sculpture, including an idealized portrait of the versatile king Mahendravarman and his queens (pl. XLII), and a number of free-standing animal figures, which are remarkable for their simple strength.

The influence of the Pallava school of sculpture was felt in Ceylon (pl. XLIIIa), and also in the Western Deccan. Here the Buddhist carvings of the Ajantā caves, though important, are dwarfed in significance by the wonderful mural paintings. The carvings of the later Ellorā caves, on the other hand, especially those of the Kailāsanātha Temple (p. 354), are among the finest sculptures of India. They are chiefly in the form of deep reliefs, giving the effect of free-standing sculpture, and illustrate scenes of mythology (pl. XLIIIb). The whole series of reliefs is characterized by balanced design, and a graceful energy akin to that of Amarāvati. Of the same school, but a century or two later, are the cave sculptures of Elephanta. The rock temple of Śiva contains a fine series of deep reliefs, all of which are dwarfed in significance by the colossal *Trimūrti*, which is perhaps the best known of all Ancient Indian sculptures (pl. XLIIIc). The three-headed bust of Śiva, calm with the calmness of eternity, is so impressive and so religiously inspired that it needs little comment. The serene god is perhaps the highest plastic expression of the Hindu concept of divinity.

After Māmallapuram, Ellorā and Elephanta much stone sculpture was produced in the Peninsula, but though often of great merit it lacked the depth and beauty of the work of the earlier schools. The

splendid bronzes of the Cōlas and their successors are the most outstanding products of the Dravidian artists of the later Middle Ages.

TERRACOTTAS

While the rich delighted in figures of stone, metal or ivory, poorer folk contented themselves with small images and plaques of baked clay, no doubt originally painted in bright colours. Nearly every archæological site in India, from Harappā onwards, has produced many of these terracotta objects. Most are religious. Crude clay figures of goddesses—apparently early forms of Durgā, worshipped by the lower classes before her inclusion in the orthodox pantheon—are common, and recall the similar but even cruder mother-goddess figurines of Harappā (fig. ii, p. 13). Other objects have little if any religious significance, though they may have been charms or votive offerings; figures of mother and child, a type rare in sculpture, suggest offerings made by childless women, while the numerous figures of a man and a woman (pl. LXII*b*), standing in modest poses reminiscent of the donors of the cave temple sculpture, may have been charms for a happy marriage. While many terracottas are crude, others are of fine workmanship and real beauty. Some faces are well characterized and divine heads are sometimes beautifully modelled (pl. LXII*c-d*). The terracotta plaques often have much charm.

Most of the terracottas so far found date from the Mauryan to the Gupta period, but the art of modelling in terracotta must have existed earlier, and certainly continued later, for the Buddhist sites of Bihār have yielded many medieval votive plaques of no great artistic interest.

METAL SCULPTURE AND ENGRAVING

Several works of art in metal, very Hellenistic in style, have been found in the North-West, dating from the early centuries of the Christian era. Some of these are quite un-Indian, and may have been imported, or produced by foreign craftsmen, for instance the lovely little golden and jewelled reliquary casket from Bīmārān (pl. LXXXVII*a*). Further afield, in Soviet Central Asia and Northern Afghānistān, have been found beautiful silver cups and other objects, ornamented with motifs usually Hellenistic in inspiration and technique, but showing clear evidence of Indian contacts (pls. LXXXV–VI). Soviet archæologists believe that these are the products of the Greek kingdom of Bactria, and date from the 3rd and 2nd centuries B.C. Thus they are

in no way connected with the Gandhāra sculpture of the early centuries of the Christian era. Wholly Indian in style, and dating from pre-Gupta times, is the copper vase from Kulū, on the borders of Kashmīr, engraved with a gay procession (fig. xxiii).

From the Gupta period a number of bronze and copper figures have survived, mostly Buddhist. The most impressive of these is the "Sultānganj Buddha" (pl. LXIII), some $7\frac{1}{2}$ feet high, now in Birmingham Museum—a graceful figure, dressed in a diaphanous cloak. Like most of the work of the period it conveys a feeling of aliveness, not by attention to realistic detail and proportion, but by the sense of movement in the slightly tilted body, the delicate fingers, lightly clasping the corners of the robe, and the face, impassively

Fig. xxiii.—Copper Vase from Kulū, *c.* 1st–2nd century, A.D. (By permission, Victoria and Albert Museum)

symmetrical yet with a vitality imparted by the delicate moulding of its features.

The use of bronze images in worship seems to have been specially prevalent among Buddhists. The Sultānganj Buddha was found in Bihār, one of the great centres of Buddhism, where one of the two great medieval schools of metal sculpture arose, under the patronage of the Pāla kings. Pāla bronzes are so numerous that there is no doubt that they were mass-produced. They were exported to South-East Asia, where they are still found, and to Nepāl and Tibet, where they provided prototypes for indigenous schools. These images are characterized chiefly by delicacy of design and ornamental detail, and

deep religious inspiration is usually lacking (pl. LXIV). The earliest Nepāl bronzes, which go back to our period, are less ornate in design, but are gilded and set with semi-precious stones, and give an impression of great brilliance and smoothness.

Other parts of India also produced metal icons, but many of those which have survived have no great artistic value. The Tamils still prefer metal to stone for the images used in temple and domestic worship, and it was in South India, especially in the kingdom of the Cōlas, that the greatest Indian works of art in metal were made, by a school of bronze-casters which has not been excelled in the world. South Indian bronzes vary in size, but many of the finest specimens are very large and heavy, their pedestals fitted with lugs for carrying in procession. The best specimens of South Indian metal work are of great grace and simplicity, for, though the statues have much ornamentation, this, as in most of the best Indian sculpture, is relieved by areas of bare smooth flesh. Physical features and the contours of face and limb are simplified and idealized, the proportions are rigidly fixed by canons laid down in iconographical textbooks, and every attribute of the deity portrayed is determined by convention. It is surprising that, bound as they were by these rigid rules, the Tamil craftsmen succeeded in producing works of such great beauty and often of considerable individuality. As well as images of the gods and goddesses the Tamil school produced many figures representing the saints of devotional theism, and portrait figures of kings and queens, who, in theory, were themselves divine, and whose images were often placed in temples among the lesser divinities surrounding the chief god.

Of the latter class the finest figures are the life-size 16th century statues of King Kṛṣṇa Deva Rāya and two of his chief queens (pl. LXXI), which still stand in a temple at Tirumalai. The faces of the queens seem quite conventional, though very beautiful, but that of the great king himself is almost certainly intended to give some idea of his actual appearance. Their hands pressed together in the gesture called *añjali*, to mark their homage and respect to the gods, their large eyes half closed, these three dignified figures seem to represent all that was good and noble in the old Hindu ideals of kingship, and, looking at them, we can understand why the king made so deep an impression on the Portuguese envoys (p. 16).

The greatest and most triumphant achievements of Tamil bronze casting are undoubtedly the dancing Śivas, of which there are many examples dating from the 11th century onwards (pl. LXVI). It was as "Lord of the Dance" (*Naṭarāja*, p. 308) that the Tamil masters specially delighted in portraying the god—a graceful young

man, his four arms delicately posed, often with a flame in the open palm of one hand and a halo of flames encircling him, one foot firm on the back of a demon, and the other raised in a posture well known in the Indian dance. Thus the god appears as the very essence of vital, ordered movement, eternal youth, and ethereal light. This is not the European conception of the highest godhead, but, once the religious background is understood, even the European can recognize in the finest specimens of the dancing Śiva a true religious inspiration, a wholly successful effort at depicting in plastic terms divine truth, beauty and joy.

An important school of bronze casting existed in Ceylon, and produced works similar in style to those of South India. The finest metal product of Ceylon is undoubtedly the lovely life-size figure of a goddess, generally believed to be that of a Buddhist Tārā, but perhaps Pārvatī, the wife of Śiva (pl. LXV). This lovely and delicate casting, now in the British Museum, can hold its own with the greatest products of the South Indian bronzesmith.

Nearly all Indian bronzes were made by the "cire perdue" process. The figure was first designed in wax, which was covered with a coating of clay. The whole was then heated, so that the wax melted away, leaving a mould to be filled with molten metal. Larger standing figures, such as the Sultānganj Buddha, which weighs nearly a ton, were often made in two parts which were then welded together.

PAINTING

Literary references alone would prove that painting was a very highly developed art in ancient India. Palaces and the homes of the rich were adorned with beautiful murals, and smaller paintings were made on prepared boards. Not only were there professional artists, but many men and women of the educated classes could ably handle a brush.

Though now all in very bad condition the surviving remains of ancient Indian painting are sufficient to show its achievement. They consist almost entirely of murals in certain of the cave temples. No doubt most temples were painted in some way, and the statuary was brightly coloured, as it often is in Hindu temples today, and here and there more elaborate schemes of mural decoration were carried out. A few caves in outlying places contain rough painted sketches of no special merit, often primitive in style, and believed by many authorities to be prehistoric. Some of the artificial caves dedicated to religious purposes, however, give us samples of the work of highly developed schools of painting, and few would dispute that the murals

Avalokiteśvara-Padmapāni. Mural painting, Ajantā.
Gupta Period.

of Ajantā are among the greatest surviving paintings of any ancient civilization.

The cave paintings of Ajantā (pls. LXXII–IX) are often referred to as frescos, but this term is incorrect, for a fresco is painted while the plaster is still damp, and the murals of Ajantā were made after it had set. The walls were first covered with a coating of clay or cowdung bound together with straw or hair, and then finished with white gypsum. Considering the climate the surface has stood well, but in many places it has flaked away, and even since they were first copied in the last century the condition of the paintings has deteriorated. The pigments, on the other hand, are still remarkably fresh; in their original state the paintings must have been of great brilliance, and their colours are even now clear and well contrasted. The artists worked in the dim caves by light reflected from outside by metal mirrors.

The paintings in Cave X have been shown with fair certainty to date from before the beginning of the Christian era, while those of Caves I and XVI are from perhaps as much as six centuries later. The earlier paintings are more sharply outlined and the later show more careful modelling, but there is no good evidence of a progressively developing style, as in contemporary sculpture, and the differences may be accounted for by the personal styles of the craftsmen who supervised the work in the respective caves. The murals chiefly depict scenes from the life of the Buddha and the Jātakas. No frame divides one scene from the next, but they blend one into the other, the minor figures and the pattern skilfully leading the eye to the central figures of each scene. There is no perspective, but an illusion of depth is given by placing the background figures somewhat above those in the foreground. The effect of this convention is rather like that of a photograph taken with a telescopic camera, and makes the figures stand out from the flat wall as though coming to meet the observer.

Though painted for religious purposes the murals of Ajantā bear rather a secular than a religious message. Here, even more vividly than at Sānchī, we see the whole life of ancient India in panorama. Here are princes in their palaces, ladies in their harems, coolies with loads slung over their shoulders, beggars, peasants and ascetics, together with all the many beasts and birds and flowers of India, in fact the whole life of the times, perpetuated on the dim walls of the caves by the loving hands of many craftsmen. Everything is gracefully and masterfully drawn and delicately modelled.

Among the many masterpieces of Ajantā we must mention the figure of a handsome young man, his body bent slightly in the pose

called *tribhaṅga*, loved by Indian sculptors and artists, with a jewelled crown on his head, and a white lotus in his right hand. His smooth features betray gentle sorrow, and his eyes look downwards compassionately, as if at something far below him (pls. LXXII–III). Around him are *apsarases*, or heavenly damsels, and divine minstrels, all much smaller than the central figure, who is the Bodhisattva Avalokiteśvara Padmapāṇi, the Lord who Looks Down in Compassion (p. 276). Here, once more, a work of deep religious feeling appears among the cheerfully sensuous scenes of everyday life. The Bodhisattva, for all his jewels and his smooth youthfulness, has shared the sorrows of the world; his gentle eyes have seen countless ages of pain, and his delicately formed lips have spoken words of consolation to countless sufferers. The artist of the Bodhisattva has conveyed his message—the universe is not indifferent to the sorrows and strivings of its creatures.

Religious feeling of a different type is found in the painting of the glorified Buddha, begging his daily bread from a woman and child believed to represent his wife Yaśodharā and his son Rāhula. The lovely portrayal of the two minor figures is scarcely noticed against the majesty of the Master, whose calm features and robed body convey, like the Sārnāth Buddha, the serenity of self-transcendence (pl. LXXIV).

A few other paintings are to be found elsewhere. Those on the walls of the veranda of a cave at Bāgh, some hundred miles to the North of Ajantā, depict a procession of elephants, perhaps more impressive in composition than anything Ajantā has to offer (pl. LXXX), and a lovely scene of a dancer and women musicians (frontispiece). Traces of paintings in the Ajantā style are to be found in other Deccan caves, notably at Bādāmi and Ellorā. Further south, in the Tamil country, a Jaina cave at a place called Sītannaval has yielded a fine, though much decayed, mural.

Some of the best preserved paintings of these schools are to be found in Ceylon. In the centre of the island a great rock, Sigiriya, the "Lion Mountain", rises sharply for 600 feet above the surrounding plain. Here, at the end of the 5th century, the parricide king Kāśyapa I built a palace and a fortress. Kāśyapa, evidently a megalomaniac, was so convinced of his own divinity that he tried to identify his rock-fortress with heaven, and had demigods and heavenly beings painted on the bare walls of the rock, to show his subjects that he transcended them all. Nearly all these paintings have vanished under the hot sun and driving monsoon rain, but half way up the rock face, preserved by an overhanging ledge, are the figures of twenty-one *apsarases* immersed from their hips downwards in banks of

cloud.* These charming ladies, toying with flowers in languid poses (pl. LXXXIII), are so freshly preserved that one can hardly believe that they were painted 1,500 years ago.

The surviving traces of medieval Hindu painting, at Tanjore, Vijayanagara, Polonnaruwa in Ceylon, and elsewhere, indicate that there was some technical decline after the 8th century. Outlines become sharper, and the delicate modelling of the earlier period is lacking, but the achievement is still considerable. Scarcely anything survives from this period in good enough preservation to make a satisfactory reproduction, but what can still be seen shows that the tradition of mural painting continued down to the Muslim invasion.

After the spread of Islāmic influence the Indian painter turned his attention mainly to miniatures and book illustration, deriving much inspiration from Persian models. Literary evidence shows that miniature painting existed long before the coming of the Muslims, however, and a few examples have survived from the 11th and 12th century from Bihār, Bengal and Nepāl (pl. LXXXIIa). These little pictures show great delicacy and skill, but they lack the comparative realism of Ajantā, and the figures are almost unmodelled. They are the products of a formalized Buddhism, the religious inspiration of which was languishing, and which was largely detached from contact with everyday life. Unlike the Ajantā murals, they are probably the work of monks, and not of secular craftsmen.

The dry sands of Central Asia have preserved paintings which, though not strictly Indian, owe much to Indian inspiration. The earliest of these surround a colossal rock-cut Buddha at Bāmiyān in Afghānistān (pl. LXXXI) and are older than most of the paintings at Ajantā. The many murals and paintings on boards found at sites in Chinese Turkistān and other parts of Central Asia are mostly somewhat later, and show greater deviation from Indian models, though their debt to India is quite evident. They date from a period when the trade route to China was wide open, and give proof of the debt which Chinese art, despite its very individual character, owes to India.

MINOR ARTS

The excavations at Takṣaśilā and other sites of the North-West have revealed fine jewellery (pl. LXXXIIb), with semi-precious

* Until recently these figures were thought to be portraits of Kāśyapa's queens and concubines, and some of the faces seem to show individual character. Some authorities might still support the older theory, but the context of the paintings leaves little doubt that the above interpretation is correct.

stones set in gold filigree, much in the manner of the Indian jewellery of the present day. The Bīmārān Casket (pl. LXXXVIIa), and a few other objects in gold and silver, are delicately worked, as are the crystal relic caskets found in Buddhist sites in many parts of India. Engraved intaglio gems from the North-Western sites are usually of no great artistic merit, and nearly all these small objects of art show the influence of western models, while some may well have been imported.

Though little survives, much beautiful work was done in ivory. Guilds of ivory carvers are mentioned in inscriptions and their profession was evidently a well-patronized and honourable one. Of surviving ivory work the most interesting if not the most beautiful specimen is a small statuette of a goddess, found at Herculaneum (pl. LXXXVIIb), no doubt imported with spices and fine textiles via Egypt. More beautiful are the ivory plaques, originally fastened to the lids and sides of boxes, found at the Kuṣāṇa site of Begrām, some fifty miles west of Kābul. Though discovered in the region most open to Western influence, the designs of these plaques are purely Indian in inspiration, and they were either imported from India proper or made by craftsmen who had learnt their trade from Indian masters (pl. LXXXVIIc). The figures are outlined with deep-cut lines, and, although only lightly modelled, give a wonderful impression of depth. Their delicacy and grace are unexcelled in any work of art of ancient India. The art of ivory carving has continued down to the present day both in India and Ceylon (pl. LXXXVIII), but it has never again produced works as lovely as these.

Since they delighted in minute detail and gave great care to the finish of their productions it is surprising that the Indians did not develop their coinage artistically. Ancient Indian coins are generally crude and ugly. Only under the Gupta emperors did they approach the status of works of art, and even the Gupta gold coins are but works of art of the second order. They have originality and charm, however. Thus Candragupta I lovingly gazes at his chief queen, Kumāradevī; Samudragupta, enthroned, performs on the harp; Candragupta II slays a rhinoceros; and Kumāragupta I rides on a splendid elephant (fig. xxive). After this, however, the standard of coin production deteriorated rapidly, and medieval kings who patronized great artists and craftsmen were satisfied with coins of the crudest type.

Exceptional are the lovely large silver coins minted by the Greek kings of Bactria, which bear some of the finest numismatic portraits in the world (pl. LXXXIVa-c); but the inspiration of these coins is purely Hellenistic, and they were no doubt designed by Greek

craftsmen. It is unlikely that they circulated widely in India, where the Greek kings issued cruder bilingual coins (pl. LXXXIV*d*), in a style followed by the later Śakas and Kuṣāṇas (pl. LXXXIV*e*).

MUSIC

There is some evidence to show that the Āryans knew the heptatonic scale, and the instructions for intoning the hymns of the *Sāma Veda* show that the style of liturgical singing in Vedic times was rather like that of medieval plain chant, and has been preserved fairly accurately by the brāhmaṇs down to the present day. Between this and the early centuries of the Christian era we have little knowledge of the progress of Indian music, but in the latter period an anonymous writer composed a textbook on drama, music and dancing, which, in accordance with the custom of the time, he attributed to the ancient sage Bharata, and which has survived to this day. The *Bhārata Nāṭyaśāstra* is our earliest Indian authority on these three arts, and shows that by this time India had a fully developed system of music, which differed little from that of present-day Indian "classical" music. Anyone who has heard a performance on the vīṇā by a good South Indian musician has probably heard music much as it was played over a thousand years ago. For this reason, and because of the highly technical nature of the subject, we treat ancient Indian music briefly.

The basic scale is heptatonic, its seven notes* corresponding approximately to those of the European major scale. They may be elaborated with half-tones or quarter-tones (*śruti*). There are twenty-two quarter-tones in the octave, which occur in the following order:

$\begin{array}{cccccccc} \text{Sa} & & \text{ri} & & \text{ga} & \text{ma} & & \text{pa} & & \text{dha} & \text{ni} & \text{sa} \\ \text{—} & & \text{—} & & \text{—} & \text{—} & & \text{—} & & \text{—} & \text{—} & \text{—} \\ \cdot & \cdot & \cdot & \cdot & \cdot & \cdot & \cdot & \cdot & \cdot & \cdot & \cdot & \cdot \end{array}$

From this diagram it will be seen that the notes *sa*, *ma* and *pa* (approximately the European *do*, *fa* and *so*) may have as many as three degrees of sharpness. The quarter-tones of Indian music are chiefly noticeable in ornamentation, when they are used with striking effect, but they also occur to some extent in melody, so that the untutored Westerner may well think that the singer or musician is out of tune.

As well as the scale based on the note *sa*, corresponding to the European major, other scales may be based on other notes of the seven, thus resembling the modes of ecclesiastical music.

Besides the *grāma*, which we have translated "scale", there are other basic classifications of tune-types, chief of which is the *rāga*. A *rāga* is a series of five or more notes, upon which a melody is based. Over thirty *rāgas* are mentioned in the *Bhārata Nāṭyaśāstra*, and the

* Called *śadjā*, *ṛṣabha*, *gāndhāra*, *madhyama*, *pañcama*, *dhaivata* and *nīsāda*, nowadays generally abbreviated to *sa*, *ri*, *ga*, *ma*, *pa*, *dha* and *ni*.

total has since grown considerably until now hundreds have been enumerated. According to orthodox theory there are six basic *rāgas*, the others being *rāgiṇīs*, personified as the wives of the masculine *rāgas*. The six original *rāgas* are variously given, the oldest list, that of Bharata, being as follows:

<i>Bhairava</i> :	C, D ^b E, F, G, A ^b , B, C.
<i>Kauśika</i> :	C, E ^b , F, A ^b , B ^b , C.
<i>Hindola</i> :	C, E, F [#] , A, B, C.
<i>Dīpaka</i> :	C, D ^b , E, F [#] , A, B, C.
<i>Śrīrāga</i> :	C, D ^b , E, F [#] , G, A ^b , B, C.
<i>Megha</i> :	C, D, F, G, A, C.

The *rāgas* are classified according to the time of day or night for which they are most appropriate. Thus, of the examples above, Bhairava is suitable for performance at dawn, Megha in the morning, Dīpaka and Śrīrāga in the afternoon, and Kauśika and Hindola at night. Bhairava is associated with awe and fear, Kauśika with joy and laughter, Hindola, Dīpaka and Śrīrāga with love, and Megha with peace and calm. It is interesting that the *rāga* most closely corresponding to the European major scale, *Pañcama*, is associated with the night and love in the Indian system.

There is no harmony in Indian music, and the melody, which usually proceeds by conjunct intervals (i.e. adjacent notes on the keyboard), never suggests a harmonic basis, as do many European melodies. The tune is sustained by a drone note and by drumming. The subtle and complex cross rhythms of Indian music take the place of harmony and counterpoint in the ear of the trained listener. Like the ancient Greeks the Indians delighted and still delight in unusual times, such as $\frac{5}{4}$ and $\frac{7}{4}$. The *tāla*, or rhythmic figure is, after the *rāga*, the most important element of Indian music. Bharata recognizes twenty-two *tālas*, and since then many more have been introduced. *Tālas* range in complexity from simple $\frac{2}{4}$ time (*āditāla*) and $\frac{3}{4}$ (*rūpaka*, stressed as | ♪ ♪ ♪ ♪ ♪ |) to such remarkable rhythms as *jhampā*, a $\frac{16}{8}$ rhythm stressed: | ♪ ♪ ♪ ♪ ♪ ♪ ♪ ♪ ♪ ♪ ♪ ♪ ♪ ♪ ♪ ♪ | or *ātā*, which has fourteen notes to the bar, thus:

| ♪ ♪ ♪ ♪ ♪ ♪ ♪ ♪ ♪ ♪ ♪ ♪ ♪ ♪ ♪ ♪ |. When two or more of these complex rhythms, each ornamented with grace notes and varied by syncopation, are sounded together, the result is a rhythmic texture nearly as difficult for a European to disentangle as a four-part fugue would be to an Indian.

The Indian musician was, and still is, an improviser. While a simple melody could be recorded in alphabetic notation India never

devised a true musical notation and the music of her ancient masters has vanished for ever. As at the present day, every performance was virtually a new composition. The musician would choose his *rāga* and *tāla* and, often starting from a well-known melody, would elaborate his theme in the form of free variations, working up to a climax of complex and rapid ornamentation.

The chief musical instrument was the *viṇā*, usually loosely translated "lute". The term was originally applied to the bow-harp, often with ten strings, of a type very similar to the small harp used in ancient Egypt and the early civilizations of the Middle East (pl. XXXVIIb). By the end of the Gupta period this instrument had begun to go out of fashion, and its place was largely taken by a lute with a pear-shaped body, played either with the fingers or with a plectrum. This in turn was superseded in the 8th century by the early form of the modern *viṇā*, with long finger-board and small round body, often made of a dried gourd. Bowed instruments may have been known, but seem to have been little used in polite circles until the coming of the Muslims. Flutes and reed-instruments of various kinds were widely played, but instruments of the trumpet type were rarely used except as signals. Of these the most mentioned was the conch, the shell of a large mollusc, blown through its sawn-off point before battle, as an invocation to a deity, and on important occasions generally; its sound was very auspicious. Percussion instruments were numerous and varied. The smaller drums, played in pairs with the fingers as at present, were looked on as almost essential for any musical performance. Larger drums were used for state occasions, and there was a wide range of cymbals, gongs and bells.

The evidence of Bharata shows that, as at the present day, the Indian of two thousand years ago preferred the throaty, rather nasal type of singing, which comes more naturally than that which Europe has learnt to appreciate. The singing voice was often treated as a musical instrument, the vocalist performing long impromptu variations on a simple melody, sung to a single phrase, often an invocation to a deity.

In the late medieval period music became largely the preserve of professionals, who, though much in demand by the well-to-do people who employed them, were of low caste. This was not the case in India's greatest days, when a knowledge of music was looked on as an essential attribute of a gentleman. "The man who knows nothing of literature, music or art," runs an ancient Indian proverb, "is nothing but a beast without the beast's tail and horns".

THE DANCE

Like music, Indian dancing has changed little with the centuries, and the best modern Indian dancers, such as Uday Shankar and Rām Gopāl, still dance according to the rules of the *Bhārata Nāṭyaśāstra*. Dancing (*nṛtya*) was closely connected with acting (*nāṭya*); in fact both are forms of the same word, the latter being a Prākṛitism, and aspects of a single art, *abhinaya*, the portrayal of the eight emotions (p. 417). The drama employed chiefly word and gesture, the dance chiefly music and gesture. As in most other civilizations there is little doubt that the Indian drama, which we consider in the following chapter, developed from ritual miming song and dance.

Indian dancing is not merely a thing of legs and arms alone, but of the whole body. Every movement of the little finger or the eye-brow is significant, and must be fully controlled. The poses and gestures are classified in detail, even as early as the *Bhārata Nāṭyaśāstra*, which mentions thirteen poses of the head, thirty-six of the eyes, nine of the neck, thirty-seven of the hand, and ten postures of the body. Later texts classify many more poses and gestures, every one of which depicts a specific emotion or object. With so many possible combinations the dancer can tell a whole story, easily comprehensible to the observer who knows the convention.

The most striking feature of the Indian dance is undoubtedly the hand-gesture (*mudrā*). By a beautiful and complicated code, the hand alone is capable of portraying not only a wide range of emotions, but gods, animals, men, natural scenery, actions and so on. Some hundreds of *mudrās* are classified in later textbooks, and they are used not only in the dance, but, as we have seen, in religious worship and iconography.

This highly developed dance style demanded years of training, and was probably always chiefly performed by professionals, though there are references in literature to princes and their ladies dancing in their palaces. Ancient India was rich in folk-dances, which were performed at festivals. In later years only low caste people would think of dancing in public, but there seems to have been no social taboo on the art in ancient times, except perhaps for practising brāhmins.

IX

LANGUAGE AND LITERATURE

I. LANGUAGE

Sanskrit

It has long been universally accepted that Sanskrit is a remote cousin of all the languages of Europe, with the exception of Finnish, Estonian, Hungarian, Turkish and Basque. All the other European tongues look back to a common ancestor in a group of dialects spoken by tribesmen in the steppelands of South Russia some 2,000 years B.C. The relationship of Sanskrit to the languages of the West is indicated by several obvious resemblances, such as *pitr*, "father", and *mātr*, "mother", and many others which are less obvious. For instance the Sanskrit *śvan*, "dog", is cognate with the Greek *κύων*, the Latin *canis*, the German *Hund*, and the English *hound*, the Germanic *h* representing an original *k*. The Sanskrit *cakra* is related to the word with the same meaning in English, *wheel*, both of which originated from a word pronounced something like *kwekulo*, which was also the ancestor of the Greek *κύκλος* and the Old English *hwæogol*, from which our word "wheel" is derived. Many hundreds of relationships of this kind, at first not obvious, have been established with virtual certainty.

The reader with a slight knowledge of Latin or Greek will immediately recognize the relationship between their verbal systems and that of Sanskrit. Thus the present tense of the Sanskrit verb *as* "to be", is declined in singular and plural as follows:

<i>asmi</i> , "I am";	<i>smas</i> , "we are";
<i>asi</i> , "thou art";	<i>stha</i> , "you are";
<i>asti</i> , "he is";	<i>santi</i> , "they are".

Vedic Sanskrit is in many ways closer than any other Indo-European language to the parent tongue, and it was the discovery of Sanskrit which enabled Bopp, Rask, and other scholars of the first half of the last century to establish a clear relationship between the languages of the Indo-European group and to develop the science of comparative philology.

The earliest surviving form of Sanskrit, that of the *R̥g Veda*, bears about the same relation to the classical tongue as does Homeric to classical Greek. At all its stages Sanskrit is a language of many inflexions, but the Vedas contain numerous forms which

later went out of use. The verb is of a complexity rivalling the Greek, with a bewildering array of voices and moods, later much simplified. The Vedic noun, as in later Sanskrit, has eight cases, and both verb and noun have dual numbers.]

An important feature of Vedic Sanskrit is the tonic accent. Every important word had an accented syllable, which was not necessarily stressed, but on which the voice rose in pitch, as in classical Greek. The tonic accent of a Sanskrit word, is, with exceptions due to the special rules of the languages, the same as in the cognate Greek word.

Sanskrit, and most of the languages derived from it, are characterized by the presence of aspirated consonants. Thus *k*, pronounced without appreciable emission of breath, is, to the Indian, quite a different sound from the aspirated *kh*, which is pronounced with a strong breathing, rather like the first sound of the English word *come*. To the average European, the difference is hardly noticeable. The distinction goes back to the Indo-Europeans, and was made in classical Greek, though in Greek the aspirate letters θ , ϕ and χ had lost their original pronunciation before the beginning of the Christian era. Another phonetic characteristic of Vedic Sanskrit, also surviving to modern times, is the series of "retroflex" or "cerebral" consonants, *ṭ*, *ṭh*, *ḍ*, *ḍh*, and *ṇ*. These, to the Indian, are quite different from the "dentals", *t*, *th*, etc., though the European finds them hard to distinguish without practice. The retroflex sounds are not Indo-European, and were borrowed very early from the indigenous inhabitants of India, either proto-Australoid or Dravidian. A further feature of the phonetics of Sanskrit is the predominance of the vowels *a* and *ā*. Vedic is a fine language, capable of vigorous and noble expression. On p. 509 we quote two verses of the Vedic hymns in the original, which will give the reader some idea of the sound of the language.

[After the composition of the *R̥g Veda* Sanskrit developed considerably. In the early centuries of the 1st millennium B.C. old inflexions disappeared, and the grammar was somewhat simplified, though still remaining very complex. New words, mostly borrowed from non-Āryan sources, were introduced, while old words were forgotten, or lost their original meanings. In these circumstances doubts arose as to the true pronunciation and meaning of the older Vedic texts, though it was generally thought that unless they were recited with complete accuracy they would have no magical effectiveness, but bring ruin on the reciter. Out of the need to preserve the purity of the Vedas India developed the sciences of phonetics and grammar. The oldest Indian linguistic text, Yāska's *Nirukta*, explaining obsolete Vedic words, dates from the 5th century B.C., and followed

much earlier work in the linguistic field. Pāṇini's great grammar, the *Aṣṭādhyayī* ("Eight Chapters") was probably composed towards the end of the 4th century B.C. With Pāṇini the language had virtually reached its classical form, and it developed little thenceforward, except in its vocabulary.

By this time the sounds of Sanskrit had been analysed with an accuracy never again reached in linguistic study until the 19th century. One of ancient India's greatest achievements is her remarkable alphabet, commencing with the vowels and followed by the consonants, all classified very scientifically according to their mode of production, in sharp contrast to the haphazard and inadequate Roman alphabet, which has developed organically for three millennia. It was only on the discovery of Sanskrit by the West that a science of phonetics arose in Europe.)

The great grammar of Pāṇini, which effectively stabilized the Sanskrit language, presupposes the work of many earlier grammarians. These had succeeded in recognizing the root as the basic element of a word, and had classified some 2,000 monosyllabic roots which, with the addition of prefixes, suffixes and inflexions, were thought to provide all the words of the language. Though the early etymologists were correct in principle, they made many errors and false derivations, and started a precedent which produced interesting results in many branches of Indian thought (p. 82).

Though its fame is much restricted by its specialized nature, there is no doubt that Pāṇini's grammar is one of the greatest intellectual achievements of any ancient civilization, and the most detailed and scientific grammar composed before the 19th century in any part of the world. The work consists of over 4,000 grammatical rules, couched in a sort of shorthand, which employs single letters or syllables for the names of the cases, moods, persons, tenses, etc. in which linguistic phenomena are classified. The great terseness of Pāṇini's system makes his work very difficult to follow without preliminary study and a suitable commentary. Later Indian grammars are mostly commentaries on Pāṇini, the chief being the "Great Commentary" (*Mahābhāṣya*) of Patañjali (2nd century B.C.) and the "Banāras Commentary" (*Kāśikā Vṛtti*) of Jayāditya and Vāmana (7th century A.D.).

Some later grammarians disagreed with Pāṇini on minor points, but his grammar was so widely accepted that no writer or speaker of Sanskrit in courtly or brāhmaṇic circles dared seriously infringe it. With Pāṇini the language was fixed, and could only develop within the framework of his rules. It was from the time of Pāṇini onwards that the language began to be called *Samskṛta*, "perfected" or

“refined”, as opposed to the *Prākṛtas* (“unrefined”), the popular dialects which had developed naturally.

Pāṇinian Sanskrit, though simpler than Vedic, is still a very complicated language. Every beginner finds great difficulty in surmounting Pāṇini’s rules of euphonic combination (*sandhi*), the elaboration of tendencies present in the language even in Vedic times. Every word of a sentence is affected by its neighbours. Thus *na-avadat* (“he did not say”) becomes *nāvadat*, but *na-uvāca* (with the same meaning) becomes *novāca*; *Rāmas-uvāca* (“Rāma said”) becomes *Rāma uvāca*, and *Rāmas-avadat* becomes *Rāmo ’vadat*, but *Haris-avadat* (“Hari said”) becomes *Harir avadat*. There are many rules of this kind, which were even artificially imposed on the *R̥g Veda*, so that the reader must often disentangle the original words to find the correct metre.

Pāṇini, in standardizing Sanskrit, probably based his work on the language as it was spoken in the North-West. Already the lingua franca of the priestly class, it gradually became that of the governing class also. The Mauryas, and most Indian dynasties until the Guptas, used Prākṛit for their official pronouncements. The first important dynasty to use Sanskrit was that of the Śakas of Ujjain, and the inscription of Rudradāman at Girnar (p. 62) is the earliest written Sanskrit document we possess, with the exception of a few inscriptions which are brief and unimportant.

As long as it is spoken and written a language tends to develop, and its development is generally in the direction of simplicity. Owing to the authority of Pāṇini, Sanskrit could not develop freely in this way. Some of his minor rules, such as those relating to the use of cases indicating past time, were quietly ignored, and writers took to using imperfect, perfect and aorist indiscriminately; but Pāṇini’s rules of inflexion had to be maintained. The only way in which Sanskrit could develop away from inflexion was by building up compound nouns to take the place of the clauses of the sentence.

In the Vedic and Epic literature compound nouns are common enough, but they are usually of only two or three members, like the English “houseboat”, or “blackbird”. In classical Sanskrit, on the other hand, they may have as many as twenty or thirty members. Earlier classical poets such as Kālidāsa are comparatively restrained in their use of compounds, though even in poetry compounds of six elements are not uncommon; but the earliest royal panegyrics in Sanskrit employ enormous compounds. For instance the emperor Samudra Gupta is referred to as “binding together the whole world by putting forth his strength and by [accepting] acts of service [from other kings], such as paying personal homage, the presentation of

gifts of maidens, and soliciting his charter, sealed with the Garuḍa-seal, to confirm them in possession of their territories" in a single word of twenty components.* This remarkable use of long compounds may be due to the influence of Dravidian speech on the language, for early Tamil has few inflexions, and its words are put together in concatenations without definite indication of their relationship. If the components of a Sanskrit compound word are thought of as separate words, as in such an English phrase as "my top right-hand waistcoat pocket" which in Sanskrit would be treated as a single compound word, the new constructions of the classical period become intelligible.

With the growth of long compounds Sanskrit also developed a taste for long sentences. The prose works of Bāṇa and Subandhu, written in the 7th century, and the writings of many of their successors, contain single sentences covering two or three pages of type. To add to these difficulties writers adopted every conceivable verbal trick, until Sanskrit literature became one of the most ornate and artificial in the world.

The interest in language which India had shown from the earliest times continued in the medieval period. A number of valuable "dictionaries" survive from this time; these are not comparable to the alphabetically arranged dictionaries of the West, but rather to such works as *Roget's Thesaurus*. They contain lists of words of approximately the same meaning or used in similar contexts, sometimes with brief definitions, the whole arranged in simple verse. The most famous lexicographer, and the earliest whose work has survived, was Amarasiṃha, by tradition a contemporary of Kālidāsa. Another form of dictionary, more akin to our own, was the list of homonyms, classifying words with more than one meaning.

Indian interest in language spread to philosophy, and there was considerable speculation about the relations of a word and the thing it represented. The Mīmāṃsā school (p. 327), reviving the verbal mysticism of the later Vedic period, maintained that every word was the reflexion of an eternal prototype, and that its meaning was eternal and inherent in it. Its opponents, especially the logical school of Nyāya (p. 323), supported the view that the relation of word and meaning was purely conventional. Thus the controversy was similar to that between the Realists and Nominalists in medieval Europe.

Classical Sanskrit was probably never spoken by the masses, but it was never wholly a dead language. As the official tongue of church and state it was read and spoken by the upper classes, and probably

* *Ātma-nivedana-kany'-opāyana-dāna-garutmad-aṅka-sva-viṣaya-bhukti-śāsana-yācan'-ādy-upāya-sevā-kṛta-bāhu-vīrya-prasara-dharaṇi-bandhasya.*¹

understood to some extent by many of the lower orders. It served as a lingua franca for the whole of India, and even today learned brāhmaṇs from the opposite ends of the land, meeting at a place of pilgrimage, will converse in Sanskrit and understand each other perfectly.

Prākritis and Pāli

The language of the *R̥g Veda* was already rather archaic when the hymns were composed, and the ordinary Āryan tribesman spoke a simpler tongue, more closely akin to classical Sanskrit. In the Veda itself there is evidence of dialectical differences. By the time of the Buddha the masses were speaking languages which were much simpler than Sanskrit. These were the Prākritis, of which several dialects have been attested.

The everyday speech of ancient India has been preserved for us largely through the unorthodox religions, whose earliest scriptures were composed in languages approximating to those spoken by the people. Most inscriptions of pre-Guptan times, notably the great series of Aśokan edicts, are in Prākritis, and the women and humbler characters of the Sanskrit drama are made to speak in formalized Prākrit of various dialects. A few works of secular literature were composed in Prākrit. Thus there is much material for reconstructing the popular languages.

Prākritis were much simpler than Sanskrit both in sound and grammar. Except for certain combinations which were easy to pronounce, such as doubled consonants, or compounds of which a nasal letter was the first member, groups of consonants were drastically simplified. Consonants at the ends of words disappeared, and, in some dialects, even single consonants in the middle of words were omitted. The diphthongs *ai* and *au* of Sanskrit vanished, as did the old vowels *r̥* and *l̥*, the correct pronunciation of which was almost forgotten very early. In one dialect, Māgadhī, *r̥* regularly became *l̥*, giving *lājā* for *rājā*. The rules of euphonic combination were practically ignored, and the dual number disappeared, while the inflexions of the noun and verb were much reduced.

One very important and early Prākrit was Pāli, which became the language of the Sthaviravādin Buddhists. Buddha probably taught in Māgadhī, but as his doctrines spread over India they were adapted to the local dialects. The language chosen by the Sthaviravādins was a Western one, probably spoken in the region of Sāñchī and Ujjayinī. Pāli, which is still the religious language of the Buddhists of Ceylon, Burma and South-East Asia, seems to look back rather to Vedic than to classical Sanskrit.

Māgadhi was the official language of the Mauryan court, and the edicts of Aśoka were composed in it, though the language in which they are inscribed in different parts of India is evidently affected by local vernaculars. A later hybrid Māgadhi, somewhat influenced by the Western Prākritis and usually known as *Ardha-māgadhi* ("Half Māgadhi"), became the sacred language of the Jainas, and a large literature is written in it.

Other important Prākritis were Śaurasenī, spoken originally in the western part of modern Uttar Pradesh, and Māhārāṣṭrī, spoken in the north-western Deccan. Śaurasenī was particularly used in drama, for the speech of women and respectable people of the lower orders. Māhārāṣṭrī was a literary language, especially popular for lyric song. There were several other Prākritis of lesser importance. By the time of the Guptas the Prākritis were standardized and had lost their local character. The vernaculars had already developed beyond them. What Pāṇini did for Sanskrit others did for the Prākritis, and they began to bear little resemblance to the languages actually spoken. Dramatists, employing various Prākritis by convention, thought first in Sanskrit, and produced their Prākrit passages by following mechanically the rules for conversion from one language to another as laid down by the grammarians.

Another stage in the development of the Indo-Āryan language was *Apabhraṃśa* ("falling away"), a vernacular of Western India which achieved literary form in the Middle Ages and was used by Jaina writers in Gujarāt and Rājasthān for the composition of poetry. Its chief characteristic is the further reduction of inflexions, which are in part replaced by postpositions, as in modern Indian vernaculars. A similar degenerate Prākrit was used in Bengal by a few late Buddhist writers, and is the ancestor of modern Bengālī.

The next stage saw the development of the modern vernaculars of North India and is outside the scope of this work, although the earliest vernacular literature is little later than the end of our period. One Indo-Āryan vernacular, however, had a long history behind it by this time—this was Sinhalese, the development of which can be traced in inscriptions and literature from the 2nd century B.C. down to the present day. The prākritic dialect spoken by the early settlers of Ceylon was already far removed from the original Sanskrit. Influenced by the local speech, and also by Tamil, Sinhalese developed rapidly and independently. Very early the aspirated letters, characteristic of most Indo-Āryan languages, were forgotten. Vowels were shortened, and the short vowels *ē* and *ō*, absent in most Indo-Āryan languages, appeared, as well as a wholly new vowel, *ā*, rather like that in the English *hat*. Many words were borrowed

Head of Avalokiteśvara (plate LXXII).

The Temptation of the Buddha. Mural painting, Ajantā. Gupta Period

The Buddha receiving Alms from a
Woman and Child. Ajantā

from the aboriginals and the Tamils. By the beginning of the Christian era Sinhalese was no longer a Prākṛit, but a distinct language. Surviving Sinhalese literature dates from the 9th century A.D., but it is certain that there was much earlier work which is now lost.

Dravidian Languages

While the modern Indo-Āryan languages, with the exception of Sinhalese, had not found literary expression at the time of the Muslim invasion, the Dravidian languages had been flourishing for centuries.

Four of these tongues have distinctive scripts and written literatures—Tamil, Canarese, Telugu and Malayālam. Of these Tamil is spoken in the south, from Cape Comorin to Madras, Canarese in Mysore and parts of Hyderābād, Telugu from Madras northward to the borders of Orissā and Malayālam in Malabār. Tamil is certainly the oldest of these languages, with a literature going back to the early centuries A.D.

Some authorities believe that the Dravidian languages are remotely affiliated to the Finno-Ugrian group, which includes Finnish and Hungarian.² If this is the case it involves interesting corollaries concerning prehistoric race movements, but the hypothesis is not absolutely certain. Dravidian is virtually an independent group of languages with a distinctive character. Its sound system is rich in retroflex consonants, which give it a crisp flavour, and its varied vowels (including *ē* and *ō*, not present in Sanskrit) distinguish it from the northern languages, where the vowels *a* and *ā* predominate. Like Sanskrit it has a complicated system of euphonic combination. It does not recognize the aspirated consonants of Indo-Āryan languages—by the peculiar phonetic laws of Tamil, Sanskrit *bhūmi* ("earth") becomes in Tamil *pūmi*.

Tamil is not inflected, in the sense that Sanskrit is, but the relations of one word with another, and the number, person and tense of verbs, are shown by suffixes, which may be piled up one upon another indefinitely. Sanskrit began to affect the language very early, and by the Middle Ages the learned looked on their suffixes as nominal and verbal endings, on the analogy of Sanskrit. In the oldest texts, however, these suffixes are sparingly used, and related words are juxtaposed in clusters, with few if any indications of their relationship one to another—a system similar to the great compound words of Sanskrit, and giving much difficulty to all but the expert.

The earliest Tamil literature contains comparatively few Sanskrit loan-words, and those it does contain are generally adapted to the Tamil phonetic system. The gradual growth of Āryan influence resulted in the borrowing of many more words in the Middle Ages,

often in their correct Sanskrit form. Telugu and Canarese, which are spoken further north, are naturally even more strongly influenced by Sanskrit. Canarese first appears in inscriptions at the end of the 6th century, and its earliest surviving literature goes back to the 9th. Telugu does not appear as a literary language until the 12th century and only becomes really important under the Vijayanagara Empire, of which it was the court language. Malayālam, very closely akin to Tamil, became a separate language in the 11th century.

Writing

We have seen that the people of the Harappā Culture had a script, which cannot be deciphered. From the time of the fall of Harappā, perhaps about 1550 B.C., to the middle of the 3rd century B.C. no Indian written material has survived. References to writing occur in the Pāli scriptures of the Buddhists, and in the Sūtra literature, but there is no clear mention of it in the Vedas, Brāhmaṇas or Upaniṣads. This negative evidence, however, is not wholly conclusive, and some form of script may have been used by merchants. The Aśokan inscriptions, which are the earliest important written documents of India, are engraved in scripts almost perfectly adapted to the expression of Indian sounds. It is generally thought that the scripts had many years, perhaps many centuries, of development before the days of Aśoka.

The Aśokan edicts employ two scripts. The most important, used everywhere in India except the North-West, was *Brāhmī*, about the origin of which two theories exist. Most Indian authorities would now maintain that the script was derived from that of Harappā. Many Europeans and some Indians believe that it was derived from a Semitic script. The first theory, tentatively put forward by Sir Alexander Cunningham and elaborated by the Assyriologist Professor S. Langdon,³ has many difficulties. Until we know the pronunciation of the 270 Harappā signs we cannot be sure that the dozen or so letters of the Brāhmī script which somewhat resemble them are derived from them, and with so many Harappā signs it is unlikely that no resemblances at all should have been found. Similarities between Brāhmī and some early North Semitic scripts are perhaps more striking, especially as the latter offer only twenty-two letters to choose from,⁴ but the resemblances are still not strong enough to be altogether convincing, and the whole problem needs re-opening.

Brāhmī (fig. xxv) is normally read from left to right, as are European scripts, while the Semitic scripts read from right to left. A very defective series of Aśokan inscriptions at Yerragudi in

Madras, a very early Sinhalese inscription, and an early coin from Eran in Madhya Pradesh, are read from right to left,⁶ which would suggest that this was the original direction of Brāhmī. But this is no evidence of its origin, since it is believed that the Harappā script was also read from right to left.

Whatever its ultimate origin Brāhmī is so skilfully adapted to the sounds of Indian languages that its development must have been at least in part deliberate. In the form in which we have it, it is the work not of merchants but of brāhmaṇs or other learned men who knew something of the Vedic science of phonetics. It may have begun as a mercantile alphabet, suggested by the shapes of Semitic letters, or by vague memories of the Harappā script, but by the time of Aśoka, though still not completely perfect, it was the most scientific script of the world.

The words of Semitic languages, based largely on roots of three consonants modified by internal vowel changes, needed few indications of vowels to prevent ambiguity, and until comparatively late times vowels were marked only at the beginning of words, and then not perfectly. The Greeks, when they borrowed the Phœnician alphabet, adapted it to express vowels other than *a* by the introduction of new signs. The Indians, on the other hand, expressed their vowels by the modification of the basic letter, which was looked on as containing an inherent short *a*. Thus the Brāhmī letter † is not *k*, but *ka*. Other vowels were indicated by ticks attached to the top or bottom of the letter, thus: † *kā*, †̣ *ki*, †̤ *kī*, †̥ *ku*, †̦ *kū*, †̧ *ke*, †̨ *ko*. Two consonants together were expressed by placing one under the other; thus † *ka* and †̣ *ya* combined to form †̣̣ *kya*. No word in Prākṛit ends with a consonant, except with the final *m*, which was expressed by a dot, thus: †̣̣̣ *kaṃ*. In writing Sanskrit, at a later time, a consonant ending a sentence or line of poetry was marked by a diagonal stroke thus †̣̣̣̣ *k*. The words of a sentence were not generally divided, the final letter of one being combined with the initial letter of the other; with some modification this is still the practice in the case of Sanskrit, though not of the vernaculars, and adds to the difficulties of the language for the beginner.

Local variations of the Brāhmī script are evident even at the time of Aśoka. In the following centuries these differences developed further, until distinct alphabets evolved. Before the beginning of the Christian era engravers in the north, no doubt following the custom of scribes, began to add little ticks (called in European printing terminology serifs) to the letters, and to employ flourishes of various kinds. The tendency to ornamentation increased with the centuries, until in the late medieval period the serifs at the tops of

Translation.

In the year of Aya * 136, in the month Āṣāḍha on the 15th day.
 On this day the relics of the Lord (Buddha) were deposited by
 Urasaka the Bactrian, the son of Iṇṭavhria, a citizen of the town of
 Noaca. These relics of the Lord were deposited by him in his own
 Bodhisattva chapel of the Dharmarājika (Stūpa) of Takṣaśīlā, for
 the blessing of health for the great King, the King over Kings,

the Son of the Gods, the Kuṣāṇa, and in reverence to all the Buddhas,
 in reverence to all the Pratyeka Buddhas,† in reverence to the
 Arhants,‡ in reverence to all beings, in reverence to his mother and
 father, in reverence to his friends, his advisers, his kinsmen, and
 those of common blood, and for the boon of health and Nirvāṇa for
 himself. May right renunciation be widespread.

* The correct interpretation of this word is much disputed. † See p. 274. ‡ See p. 275.

letters were joined together in an almost continuous line, to form the *Nāgarī* ("City" alphabet, also called *Devanāgarī*, "Script of the City of the Gods"), in which Sanskrit, Prākṛit, Hindī and Marāṭhī are written at the present day. Local variations led to the development of individual scripts in the Panjāb, Bengal, Orissā, Gujarāt and elsewhere.

Meanwhile in the Deccan scripts had been growing even more florid. In Central India in the 5th and 6th centuries a script evolved which substituted square boxes for the serifs of the northern scripts, and introduced several other elaborations. The scripts of the Southern Deccan and Ceylon became more and more circular in form, until in the Middle Ages they approximated to those of the present day. The Tamils, on the other hand, evolved an angular script known as *Grantha*, which is still sometimes used in the Tamil country for writing Sanskrit, and from which the modern Tamil alphabet is derived. Thus by the end of our period the alphabets of India differed little from those of today.

It was from India, especially from the south, that the people of South-East Asia learnt the art of writing. The earliest surviving South-East Asian inscriptions, found in Borneo and Malaya, and dating from the 4th or 5th centuries, are in fairly correct Sanskrit, and in a script resembling that of the early Pallavas. Though superficially very different, every South-East Asian script, except of course the Arabic and Roman scripts in which Malay is written, can be traced back to Brāhmī. Scripts of Indian type have been used as far eastward as the Philippine Islands.

The origin of the other Aśokan script, called *Kharoṣṭhī* (a strange term, meaning "Ass-lip") (fig. xxvi), is not in doubt. It was certainly derived from the Aramaic alphabet, which was widely used in Achæmenid Persia, and was also known in North-West India. Many Kharoṣṭhī letters closely resemble Aramaic, and, like Aramaic, the alphabet is read from right to left. Kharoṣṭhī was adapted to the sounds of Indian languages by the invention of new letters and the use of vowel marks, which were lacking in Aramaic. It is generally thought that Kharoṣṭhī was adapted from Aramaic under the influence of Brāhmī, but the priority of the two scripts is not absolutely certain. Kharoṣṭhī was little used in India proper after the 3rd century A.D., but it survived some centuries longer in Central Asia, where many Prākṛit documents in Kharoṣṭhī script have been discovered. Later, Kharoṣṭhī was replaced in Central Asia by a form of the Gupta alphabet, from which the present-day script of Tibet is derived.

The usual writing material was the leaf of the talipot palm (*tālapatra*, in Tamil *ōlai*), dried, smoothed, sized and cut into strips.

To form a book a number of such strips was held loosely together by a cord passed through a hole in the centre of the leaf, or, in the case of large books, by two cords at either end. The book was usually strengthened by wooden covers, which were often lacquered and painted (pl. LXXXIIa). Palm leaves are still sometimes used as writing material in the outlying parts of South India. In the Himālayan districts, where supplies of dried palm leaf were difficult to obtain, it was replaced by the inner bark of the birch tree, which, carefully pared and smoothed, served the purpose excellently. As well as these materials, sized cotton and silk, and thin slips of wood or bamboo were also used, and important documents were engraved on copper plates (pl. LXXXIX). Paper, traditionally invented in China in the early 2nd century A.D., may have been known in North India and it was certainly widely used in Central Asia.⁶

In most of India ink made from lampblack or charcoal, applied with a reed pen, was the usual writing medium. In the South, however, the letters were usually scratched on the palm-leaf with a stylus, and the leaf then rubbed over with finely powdered lampblack. This system of writing gave the letters a fine sharp outline and allowed the use of very small script; it probably encouraged the development of the angular forms of the Tamil alphabet.*

II. LITERATURE

Vedic Literature

We have already dealt with the Four Vedas, the Brāhmaṇas and the Upaniṣads in many contexts, and have given extracts from them (pp. 234–56). In their literary aspect many of these scriptures are of high merit, especially some hymns of the *Rg Veda* and some parts of the early Upaniṣads; much, on the other hand, is dry and monotonous, or can only be appreciated after a considerable effort of the imagination.

The 1028 hymns of the *Rg Veda* are the work of many authors and show great variation of style and merit. Though their composition may have covered as many as five centuries, even the earliest of these poems is the product of a long tradition, composed according to a strict metrical scheme,† and a settled literary convention.

The collection is divided into ten “circles” (*maṇḍala*) or books. Of these, books ii to vii are ascribed to individual families of seers, and contain the earliest hymns; books i, viii, and x are later, especially

* For further information on the Indian alphabet see Appendix, p. 506ff.

† For notes on the prosody of ancient Indian poetry see Appendix, p. 508ff.

parts of x, while the ninth book was compiled by extracting the hymns to the god Soma from the other parts of the *Rg Veda*. The hymns contain many repetitions and the majority have a general sameness of outlook. Owing to their archaic language and the obscurity of their allusions many passages are not fully understood. The reader will already have obtained some idea of the style of the *Rg Veda*, as far as it can be conveyed in fairly literal translation, from the passages already quoted. We add here a few further translations of hymns of special literary merit.

Our first translation describes Indra's fight with the cloud-dragon Vṛtra. The hymn evidently refers to a well-known legend, which has since been forgotten, but which was probably a variant of the creation myth of Mesopotamia, in which the god Marduk slays the demon of chaos, Tiamat, and creates the universe. Here Indra's function as a rain-maker is also in evidence, and, if the story was originally borrowed from Mesopotamia, it had evidently developed far from its prototype. Interesting is the fleeting reference to Indra's fear, from which it would seem that his battle with the dragon did not go all his own way. The last verse is evidently an addition by another hand.

"Let me proclaim the valiant deeds of Indra,
the first he did, the wielder of the thunder,
when he slew the dragon and let loose the waters,
and pierced the bellies of the mountains.

"He slew the dragon lying on the mountain,
for Tvaṣṭṛ * made him a heavenly thunderbolt.
The waters suddenly, like bellowing cattle,
descended and flowed on, down to the ocean.

"In his strength he chose the soma—
from three cups he drank the essence.
The Generous seized his thunderbolt,
and smote the firstborn of dragons.

"When, Indra, you slew the firstborn of dragons,
and frustrated the arts of the sorcerers,
creating sun and heaven and dawn,
you found no enemy to withstand you.

"Indra slew Vṛtra, and Vyāmsa, stronger than Vṛtra,
with his thunderbolt, with his mighty weapon.
Like the branches of a tree felled by the axe
the dragon lay strewn over the earth.

* The Vedic Vulcan.

- “Like an enraged coward he called a challenge
to the great hero, the strong’s oppressor, charging.
But he did not escape the force of his blows—
the foe of Indra crushed the clouds together [in falling].
- “Footless and handless, he still gave Indra battle,
until the thunderbolt struck him hard on his back.
The bullock sought to be match for the bull,
but Vṛtra lay, his members scattered afar.
- “The waters, flowing for man’s good, pass over him,
as he lies thus, broken like a reed.
Beneath the waters which he had encompassed
in his great might, Vṛtra the serpent lay.
- “The strength of the mother of Vṛtra was exhausted,
and Indra bore away her weapon.
The mother lay above, the son below.
Dānu lay like a cow beside her calf.
- “Fallen in the midst of water-courses,
never pausing, never resting,
floods overwhelm the hidden corpse of Vṛtra.
In a long darkness lay the foe of Indra.
- “Lorded by Dāsas and guarded by the dragon
the waters lay, penned in as cows by a Paṇi.
When the opening of the waters was closed up
the slayer of Vṛtra threw it open.
- “O Indra, you became a wreath of vapour,*
when he impaled you on his lance. Alone
you won the cows, hero, you won the soma,
and you let loose the Seven Streams to flow.
- “Thunder and lightning availed him nothing,
nor the mist he scattered abroad, nor hail.
When Indra and the dragon fought he conquered,
as he, the Generous, will in future conquer.
- “And what avenger of the dragon did you see,
Indra, as fear entered your heart when you had killed him,
when you crossed over nine and ninety streams,
as a frightened hawk crosses the skies?
- “Indra is king of all that moves or rests,
of tame and fierce, the wielder of the thunder.
He is the king of mortals, whom he rules,
encircling them as a wheel’s rim the spokes.”⁷

* Literally “a horse’s tail”, probably implying a wisp of cloud.

A number of hymns show deep feeling for nature, the most famous of these being the hymns to Uṣas, the goddess of dawn; but the hymns to Uṣas are perhaps less beautiful than the single hymn to Rātrī, the personified night.

“The goddess Night has looked abroad
with her eyes, everywhere drawing near.
She has put all her glories on.

“The immortal goddess now has filled
wide space, its depths and heights.
Her radiance drives out the dark.

“Approaching, the goddess has expelled
her sister Dawn.
Now darkness also disappears.

“And so you have drawn near to us,
who at your coming have come home,
as birds to their nest upon the tree.

“The clans have now gone home to rest,
home the beasts, and home the birds,
home even the hawks who lust for prey.

“Guard us from the she-wolf and the wolf,
and guard us from the thief, O Night,
and so be good for us to pass.

“For darkness, blotting out, has come
near me, black and palpable.
O Dawn, dispel it like my debts.

“I have offered my hymn as a cow
is offered, Daughter of Heaven. O Night,
accept it, as a victor praise.”⁸

Similarly sensitive to the moods of nature is the little hymn to Araṇyāni, the elusive spirit of the forest.*

“Lady of the Forest! Lady of the Forest!
who seem to vanish from sight in the distance,
why do you never come to the village?
Surely you are not afraid of men!

* The exact meanings of several words and phrases of this hymn are quite uncertain. In translating I have given the sense which seems to me most probable, and filled out the elliptical Sanskrit to make the meaning clearer.

“When the grasshopper replies
to the distant lowing of cattle,
as though to the sound of tinkling bells
the Lady of the Forest makes merry.

“Sometimes you catch a glimpse of her, and think it is cattle grazing,
or a house, far away,
and at evening you hear the Lady of the Forest
like the distant sound of moving wagons.

“Her voice is as the sound of a man calling his cattle,
or as the crash of a felled tree.
If you stay in the forest in the evening,
you will hear her like a far voice crying.

“But the Lady of the Forest will not slay
unless an enemy draws near.
She eats the sweet wild fruits,
and then she rests wherever she will.

“Now I have praised the Lady of the Forest,
who is perfumed with balm, and fragrant,
who is well fed, although she tills not,
the mother of all things of the wild.”⁹

A few Vedic hymns are by our standards primarily secular. Of these the “Gamester’s Lament” is the most famous. Probably the poem was originally a spell to ensure success in gaming, addressed to the *vibhīdaka* nuts themselves. This was converted by an anonymous poet into a cautionary poem, which obtained a place in the *R̥g Veda* on account of its reference to the god Savitr̥ as attempting to reform the gamester.

“The dangling nuts, born where the wind blows the lofty tree,
delight me with their rolling on the board.
The cheering *vibhīdaka* has brought me joy,
like a draught of soma from Mount Mūjavant.

“She did not scold me, or lose her temper.
She was kind to my friends and me.
But because of a throw too high by one
I have rejected my loving wife.

“Her mother hates me; my wife repels me—
a man in trouble finds no one to pity him.
They say, ‘I’ve no more use for a gambler
than for a worn-out horse put up for sale.’

“When the conquering die has got his possessions
 others embrace the gamester’s wife.
 His father, his mother, his brothers say of him:
 ‘We don’t know him! Take him as a bondman!’

“I think to myself: ‘I won’t go with the others!
 I’ll stop behind when my friends go to play!’
 But then the brown ones * raise their voices,
 and off I go, like a mistress to her lover.

“The gambler goes to the hall of assembly.
 ‘Shall I win?’ he wonders. His body trembles.
 The dice run counter to his hopes,
 and give his opponent the lucky throws.

“The dice are armed with hooks and piercing,
 they are deceptive, hot and burning.
 Like children they give and take again, they strike back at their
 conquerors.
 They are sweetened with honey through the magic they work on
 the gambler.

“They play in a troop of three times fifty.
 Like the god Savitr, they are true to their laws.
 They will not bend to the wrath of the mighty,
 and even a king bows low before them.

“The dice roll down, the dice leap upwards,
 unarmed they withstand the man with arms.
 They are heavenly coals, strewn over the board,
 and though they are cool they burn up the heart.

“The forsaken wife of the gambler sorrows,
 and the mother of the son who wanders afar.
 In debt, in fear, in need of money,†
 he goes by night to the house of others.

“The gambler grieves when he sees a woman,
 another man’s wife, in their pleasant home.
 In the morning he yokes the chestnut horses.‡
 In the evening he falls by the hearth, a beggar.

* I.e. the vibhidaka nuts, loosely translated “dice”. See p. 207f.

† Literally “wealth”. It is almost certain that there was no coined money in India at the time of this poem’s composition (p. 220).

‡ I.e. gambles with the brown nuts.

“So to the general of your great army,
to him who is king, the chief of your host,
I say, stretching out to him my ten fingers:
‘I risk my all! I am speaking the truth!’

“Don’t play with dice, but plough your furrow!
Delight in your property, prize it highly!
Look to your cattle and look to your wife,
you gambler!’ Thus noble Savitr tells me.

“So make friends with us, be kind to us!
Do not force us with your fierce magic!
May your wrath and hatred now come to rest!
May no man fall into the snares of the brown ones!”¹⁰

We need say little here of later Vedic literature. The *Atharva Veda*, in the main a monotonous collection of spells, contains a few poems of great merit. The prose Brāhmaṇas and the various recensions of the *Yajur Veda* are in general without any pretensions to literary qualities, though written in simple straightforward language, very different in style from Classical Sanskrit. Here and there legends are told in terse nervous prose, which gains in effectiveness from its austere economy. We give the story of Purūravas and Urvaśī, which is told in the *Śatapatha Brāhmaṇa* as part of the instructions for becoming a Gandharva (p. 238) by means of a magical sacrifice. The story is as old as the *R̥g Veda*, for one hymn¹¹ consists of a dialogue between the earthly lover and his heavenly mistress, from which the verses quoted in the Brāhmaṇa version are taken. The story was very popular in later times, and was the subject of one of Kālidāsa’s plays.

“The nymph Urvaśī loved Purūravas the son of Idā. When she married him she said: ‘You must embrace me three times a day, but never lie with me against my will. Moreover I must never see you naked, for this is the proper way to behave to us women!’

“She lived with him long, and she was with child by him, so long did she live with him. Then the Gandharvas said to one another: ‘This Urvaśī has been living too long among men! We must find a way to get her back!’

“She kept a ewe with two lambs tied to her bed, and the Gandharvas carried off one of the lambs. ‘They’re taking away my baby,’ she cried, ‘as though there were no warrior and no man in the place!’ Then they took away the second, and she cried out in the same way.

“Then he thought to himself: ‘How can the place where I am be without a warrior and a man?’ And, naked as he was, he leapt up after them, for he thought it would take too long to put on a garment.

"Then the Gandharvas produced a flash of lightning, and she saw him as clearly as if it were day—and she vanished. . . .

"Bitterly weeping, he wandered all over Kurukṣetra. There is a lake of lotuses there, called Anyataḥplakṣā. He walked on its banks, and there were nymphs swimming in it in the form of swans.

"And she noticed him, and said: 'That's the man with whom I lived!' 'Let us show ourselves to him,' they said. 'Very well' she replied, and they appeared to him [in their true forms].

"Then he recognized her and entreated her:
 'O my wife, with mind so cruel,
 stay, let us talk together,
 for if our secrets are untold
 we shall have no joy in days to come!' . . .

"Then she replied:
 'What use is there in my talking to you!
 I have passed like the first of dawns.
 Purūravas, go home again!
 I am like the wind, that cannot be caught.' . . .

"Mournfully Purūravas said:
 'Today your lover will perish,
 he will go to the furthest distance and never come back.
 He will lie in the lap of disaster,
 and fierce wolves will devour him'

"She replied:
 'Purūravas do not die! do not go away!
 do not let the fierce wolves devour you!
 Friendship is not to be found in women,
 For they have hearts like half-tamed jackals!'

"And then she said to him:
 'When I dwelt in disguise in the land of mortals
 and passed the nights of four autumns,
 I ate a little ghee once a day,
 and now I have had quite enough!' . . .

"But her heart pitied him, and she said: 'Come on the last evening of the year, then, when your son is born, you shall lie one night with me.'

"He came on the last night of the year, and there stood a golden palace. They told him to enter, and brought her to him.

"She said: 'Tomorrow the Gandharvas will grant you a boon and you must make your choice'. He said: 'You choose for me!' She answered: 'Say, "Let me become one of you!"'

"In the morning the Gandharvas gave him a boon, and he asked: 'Let me become one of you'.

“‘There is no fire among men,’ they said, ‘which is so holy that a man may become one of us by sacrificing with it.’ So they put fire in a pan, and said: ‘By sacrificing with this you will become one of us.’

“He took it and his son, and went homeward. On the way he left the fire in the forest and went to a village with the boy. When he came back the fire had vanished. In place of the fire was a pīpal tree and in place of the pan a mimosa. So he went back to the Gandharvas.

“They said: ‘For a year you must cook rice enough for four [every day]. Each time [you cook] you must put on the fire three logs of the pīpal anointed with ghee . . . and the fire which is produced [at the end of the year] will be the fire [which will make you one of us]. But that is rather difficult,’ they added, ‘so you should make an upper firestick of pīpal wood and a lower one of mimosa wood, and the fire you get from them will be the fire [which will make you one of us]. But that too is rather difficult,’ they added, ‘so you must make both the upper and lower firestick of pīpal wood, and the fire you get from them will be the fire.’

“So he made an upper and a lower firestick of pīpal wood, and the fire he got from them was the fire [which would make him one of them]. He sacrificed with it and became a Gandharva.”¹²

The Upaniṣads rank high as literature, but their chief importance is religious and they have been sufficiently treated and quoted in that setting.

Epic Literature

The earliest Indian literature of a fundamentally secular character is the two great epics, the *Mahābhārata* and the *Rāmāyaṇa*, which, though worked over by a succession of priestly editors, give clear evidence of their origin as martial legends. Their religious importance lay at first in the royal sacrificial ritual, part of which involved telling stories of the heroes of the past. This put the martial ballads into the hands of the priesthood, who, in transmitting them, often altered their superficial character, and interpolated many long passages on theology, morals and statecraft.

Of the two epics the *Mahābhārata* is the more important. It contains over 90,000 stanzas, usually of thirty-two syllables, and is therefore probably the longest single poem in the world’s literature. Traditionally the author of the poem was the sage Vyāsa, who is said to have taught it to his pupil Vaiśampāyana. The latter, according to tradition, recited it in public for the first time at a great sacrifice held by King Janamejaya, the great grandson of Arjuna, one of the heroes of the story. Stripped of its episodes and interpolations the poem tells of the great civil war in the kingdom of the Kurus, in the region about the modern Delhī, then known as Kurukṣetra.

The throne of the Kurus, whose capital was Hastināpura, fell to Dhṛtarāṣṭra. But he was blind and therefore, according to custom, was not eligible to rule, so his younger brother Pāṇḍu became king. Soon Pāṇḍu, as a result of a curse, gave up the kingdom and retired to the Himālayas as a hermit, with his two wives, leaving Dhṛtarāṣṭra on the throne. When Pāṇḍu died, his five sons, Yudhiṣṭhira, Bhīma, Arjuna, Nakula and Sahadeva, were still children, and were taken back to Hastināpura to be educated with the hundred sons of Dhṛtarāṣṭra. When he came of age Yudhiṣṭhira was consecrated heir-apparent. But the sons of Dhṛtarāṣṭra, led by the eldest, Duryodhana, resented the Pāṇḍavas, and plotted against them, though they were not legally heirs to the throne, owing to their father's blindness and the stop-gap nature of his rule. After foiling a number of plots against their lives the five brothers decided to leave the country, and travelled from one court to another as soldiers of fortune. At the court of the king of the Pañcālas Arjuna won the Princess Draupadī in a *svayamvara*, and, to avoid strife, she became the joint wife of all five brothers. Here they met their great friend and helper, Kṛṣṇa, the chief of the Yādavas. Soon after this the blind Dhṛtarāṣṭra recalled them, renounced the throne, and divided the kingdom between them and his own sons. The five brothers built a new capital at Indraprastha, not far from the modern Delhi.

But the sons of Dhṛtarāṣṭra were not content with this settlement. Duryodhana invited Yudhiṣṭhira to a great gambling match. With the aid of his uncle Śakuni, who knew all the secrets of the dice, he won from Yudhiṣṭhira his whole kingdom, including his brothers and their joint wife. A compromise was arranged, whereby the five brothers and Draupadī agreed to go into banishment for thirteen years, spending the last year incognito, after which they were to receive back their kingdom.

At the end of the thirteenth year they declared themselves, and sent to Duryodhana demanding their kingdom, according to his promise; but he returned no reply. So the brothers prepared for war. They had many friends among the kings of India, and were able to gather a great army together. Meanwhile the Kauravas (Duryodhana and his brothers) marshalled their own forces. The kings of all India, and even the Greeks, Bactrians and Chinese, took sides with one or other faction, and two enormous armies assembled on the plain of Kurukṣetra.

For eighteen days the battle raged, until at last no important chief was left alive but the five brothers and Kṛṣṇa. Yudhiṣṭhira was crowned king and for many years he and his brothers ruled peacefully and gloriously. At last Yudhiṣṭhira renounced the throne and installed Parikṣit, the grandson of Arjuna, in his place. With their joint wife the five brothers set out on foot for the Himālayas, where they climbed Mount Meru, and entered the City of the Gods.

If we ignore interpolations the style of the *Mahābhārata* is direct and vivid, though it contains many often repeated clichés and stock epithets, which are typical of traditional epic literature everywhere. The chief characters are delineated in very simple outline, but

Country Scene. Mural Painting, Ajantā. Gupta Period

Fighting Elephants. Mural Painting, Ajantā. Gupta Period

with an individuality which makes them real persons. The blind Dhṛtarāṣṭra is a weakling, anxious to do the right thing, but easily persuaded to evil. Of the five brothers the eldest, Yudhiṣṭhira, is pious, righteous and noble, but a little negative in character; Arjuna is the ideal knight, noble, generous and brave; while Bhīma is a rougher character, gluttonous and immensely strong, but not very intelligent, and completely lacking in guile. Draupadī, their wife, is a woman of spirit, who is not afraid to upbraid her five husbands on occasion. The villain Duryodhana and his associates, are not painted in the blackest of colours, but have elements of nobility and courage in their characters.

Some of the interpolated episodes are of much merit, while others are of no literary value. The longest is the *Śānti Parvan*, a dissertation on statecraft and ethics, recited by Bhīṣma, the elder statesman of the Kurus, as he lies dying on a pile of arrows after the great battle (p. 80). This has been treated elsewhere and has little merit as literature. The *Bhagavad Gītā*, the sermon of Kṛṣṇa to Arjuna before the great battle, has already been quoted (pp. 301, 340f). There are many other theological and ethical passages, as well as many narrative episodes. Some of the latter tell legends of the gods, but others are more or less secular, including the famous stories of Rāma and Sītā (p. 412f), Śakuntalā (p. 435f), and Sāvitrī (p. 181). The longest narrative episode is the story of Nala and Damayantī, told to Yudhiṣṭhira during his exile to convince him of the evils of gambling. It tells how King Nala won Princess Damayantī at a svayaṃvara, at which she chose him in preference to the gods themselves, and then lost both his queen and his kingdom at a gambling tournament, to regain them after many exciting adventures. This long story is probably as ancient as the main part of the epic, and is told in very simple verse. As a brief example of the *Mahābhārata's* narrative style we give the description of Damayantī's choice. Among the suitors at the svayaṃvara are four great gods, who, knowing that she is determined to choose Nala, have all taken his appearance, in the hope that she will choose one of them by mistake.

“Then, when the right time had come,
at the auspicious day and hour,
King Bhīma invited
the lords of earth to the bride-choice.

“When they heard, the lords of earth,
all sick at heart with love,
in haste assembled,
desiring Damayantī.

“Like great lions the kings entered
the hall, firmly founded,
with its splendid porch
and shining golden columns.

“There on their several thrones
the lords of earth sat down
all decked in fragrant garlands,
with bright gems in their ears.

“Their arms were thick
as iron bars,
shapely and smooth
as five-headed snakes.

“With lovely shining locks,
and well-formed noses, eyes and brows,
the faces of the kings were bright
as the stars in heaven.

“Then fair-faced Damayanti
entered the hall,
stealing with her splendour
the eyes and thoughts of the kings.

“When the glance of the noble
spectators fell on her limbs
there it was fixed,
and never wavered.

“Then, while the names of the kings
were being proclaimed,
the daughter of Bhīma saw
five men of the same form.

. . . .

“Whichever of them she looked at
she recognized as Nala.
Wondering in her mind,
the fair one was filled with doubt.

“‘Of all the signs of godhead
that I learned from the elders
I see not even one
in those who are standing here.’

“Thus thinking over and over,
and pondering again and again,
she resolved that the time had come
to take refuge in the gods.

“‘I heard from the mouth of the swans
that Nala had chosen me as his bride,
and so, if that be true,
may the gods show him to me!

“‘Never in word or deed
have I committed sin,
and so, if that be true,
may the gods show him to me!

“‘The gods have ordained
the king of Niṣadha to be my lord,
and so, if that be true,
may the gods show him to me!’

. . . .

“‘May the great gods, the world-protectors
take on their own true form,
that I may recognize
the king of men, of good fame!’

“When they heard Damayantī,
mournful and piteous
they did as she had asked,
and put on their true form.

“She saw the four gods
sweatless, not blinking their eyelids,
their garlands fresh and free from dust,
not touching the ground with their feet.

“But the king of Niṣadha had a shadow,
his garlands were withered,
his body bore dust and sweat,
and he blinked his eyelids.

“The modest long-eyed girl
seized the hem of his garment,
and on his shoulder she placed
the loveliest of garlands.

“She chose him for her lord,
she of the fair complexion,
and suddenly all the kings
together shouted and cheered.

“And all the gods and sages
thereupon cried bravo,
and shouted at the wonder,
praising Nala the king.”¹³

The second epic, the *Rāmāyaṇa*, is rather different from the *Mahābhārata* in style and content. It is little more than one quarter of the size of the other epic, and of its seven books the first and the last are certainly later additions. The poem, like the *Mahābhārata*, contains many interpolations, but they are much briefer and are mostly didactic. The main body of the poem gives the impression of being the work of a single hand, that of a poet whose style was based on that of the other epic, but showed some kinship to that of classical Sanskrit poetry.

Though the *Rāmāyaṇa* does not contain so many archaic features as the *Mahābhārata*, and gives the general impression of being the later of the two, the *Mahābhārata* contains as an episode the story of Rāma, in a form which suggests that the editor of the final version of the *Mahābhārata* knew the *Rāmāyaṇa*. The *Mahābhārata* as it is at present is probably later than the *Rāmāyaṇa*, but its main narrative portions are appreciably earlier.

The traditional author of the *Rāmāyaṇa* was the sage Vālmīki, a contemporary of its hero. In fact the legend was perhaps committed to verse in the form in which we have it, but excluding the first and last books, a little before the commencement of the Christian era. The central scene of the poem is Ayodhyā, the capital of the old kingdom of Kosala, and it evidently grew up in a milieu to the east of that of the *Mahābhārata*.

Daśaratha king of Kosala had four sons by his three wives; the sons' names were Rāma, Bharata, Lakṣmaṇa and Śatrughna. The four attended the court of King Janaka of Videha, where Rāma won the hand of Janaka's daughter, Sītā, at a great archery contest. Rāma and Sītā were married and for a time lived happily at the court of Daśaratha. (In this part of the story, contained in the first book of the epic, Rāma is explicitly described as an incarnation of the god Viṣṇu, and the original text has evidently been much added to and altered at a late period.)

When Daśaratha grew old he named Rāma as his heir; but his second queen, Kaikeyī, reminded her lord of a boon which he had promised her long since, and demanded its fulfilment in the banishment of Rāma and the installation of her own son, Bharata, as heir apparent. Daśaratha and Bharata both demurred, but Rāma insisted on his father fulfilling his promise, and went into voluntary exile with Sītā and his brother Lakṣmaṇa. When Daśaratha died Bharata took over the kingdom, but only as regent for the exiled Rāma.

Meanwhile Rāma, Sītā and Lakṣmaṇa dwelt as hermits in the forest of Daṇḍaka, where Rāma destroyed many demons who were harassing ascetics and villagers. Rāvaṇa, the demon king of Laṅkā (Ceylon), decided to avenge his fallen kinsmen, and, while Rāma and Lakṣmaṇa were on a hunting expedition, came to their hermitage in the guise of an ascetic, seized

Sītā, and carried her off to Laṅkā in his aerial car (*vimāna*). The brothers sought far and wide for Sītā, and enlisted the help of Sugrīva, the king of the monkeys, and his general, the brave and loyal Hanumant. Hanumant went in search of Sītā, and, leaping over the straits, at last found her in Rāvaṇa's palace. With the aid of a great army of monkeys and bears Rāma built a causeway of stones across the sea to Laṅkā. After a fierce battle Rāma, Lakṣmaṇa and their allies slew Rāvaṇa and his hosts, and rescued Sītā.

Sītā had been treated with respect by her captor, and had in no way yielded to his blandishments. But she had dwelt under the roof of another man, and Rāma, in accordance with the Sacred Law, could do nothing but repudiate her. She threw herself on a funeral pyre, but the fire-god Agni refused to accept her. After this proof of her innocence she was reunited with Rāma, and the two returned to Ayodhyā, where Bharata renounced the throne and Rāma was crowned, to rule long and righteously.

The last book, certainly an addition, gives an unnecessary sequel to the story, which was probably added on account of growing prejudice, and misgivings about Sītā's lawful status after her unwilling residence in her captor's house. The people murmured because their queen had been forced to break her marriage vows, and suspicions as to her purity were not allayed, even by her ordeal by fire. Though he was quite convinced of her innocence Rāma, whose first duty was to "please the people", was regretfully forced to banish her, and she took refuge in Vālmiki's hermitage, where she gave birth to twins, Kuśa and Lava. Years later Rāma found Sītā again, and acknowledged her sons. As final proof of her innocence she called on her mother, the Earth,* to swallow her up. The earth opened, and she disappeared. Soon after this Rāma returned to heaven, and resumed the form of the god Viṣṇu.†

The style of the *Rāmāyaṇa* is less rugged than that of the *Mahābhārata*. The latter contains occasional grammatical and prosodical errors, the former few if any. It is a work of greater art, but less vigour, though it contains many dramatic passages, and beautiful descriptive writing, which the *Mahābhārata* lacks. We give a much abridged translation of the description of the death of Rāvaṇa, which is typical of the treatment of battle in both epics.

"Then Rāma, reminded
by the words of Mātali,
took his flaming arrow
like a hissing snake. . . .

* *Sītā* means "furrow", and the heroine of the epic has some of the attributes of an agricultural goddess. According to the story she was not the natural daughter of King Janaka, but sprang from his plough while he was working in the fields. This story evidently looks back to a time when the tribal chieftain was ready to lend a hand with the work of the tribe.

† This rather grim ending to the story did not satisfy some gentler spirits. Bhavabhūti's *Uttarāmacarita*, a drama of the 8th century, concludes with the full reconciliation of Rāma and Sītā.

“He spoke a mantra upon it
as the Vedas ordain.
The strong one placed in his bow
that great and mighty arrow. . . .

“Enraged he fiercely bent
his bow against Rāvaṇa,
and, intent on his mark, he shot
the entrail-tearing arrow. . . .

“Bearing the death of the body
the arrow flew with great speed,
and tore through the heart
of the evil-working Rāvaṇa.

“Then, red with his blood and rapid,
that arrow, destroyer of bodies,
robbing the life-breath of Rāvaṇa,
drove into the face of the earth. . . .

“Swiftly struck from his hand,
his bow and his arrow
dropped, with his life-breath,
upon the ground.

“Unbreathing, with awful speed,
the glorious lord of the demons
fell from his chariot to earth,
like Vṛtra struck by the thunderbolt.*

“When they saw him fallen to earth
the remaining demons of night
in terror, their lord destroyed,
fled in every direction. . . .

“Falling, struck down by the monkeys,
they fled to Laṅkā in terror,
their faces swimming in tears,
piteous at the loss of their refuge.

“And in joy the monkeys
roared a cheer of triumph
and proclaimed the victory of Rāma,
and his slaying of Rāvaṇa.

* See p. 400f above.

"In the sky there sounded
the lovely drums of the gods,
and there blew a pleasant wind
bearing a heavenly fragrance.

"A rain of flowers fell
from heaven upon earth,
flowers rare and lovely
bestrewing Rāma's chariot."¹⁴

The epic style and metre became usual for didactic literature of all kinds. Much of this, the Purāṇas, Dharma Śāstras, and other texts, has been referred to elsewhere. They contain passages of literary merit, but we must pass them over for the great body of courtly literature.

Classical Sanskrit Poetry

The earliest surviving Sanskrit poetry in the classical style is that of the Buddhist poet Āśvaghoṣa, who is believed to have lived at the end of the 1st century A.D., and who composed a metrical life of the Buddha (*Buddhacarita*) in a comparatively simple classical style. The Girnar Inscription of Rudradāman, dated A.D. 150, is the earliest surviving example of courtly Sanskrit prose. Thus the courtly style is a comparatively late development in Indian literature, although it must have had a long period of evolution before the dates which we have mentioned.

On the whole classical Sanskrit literature has not been well received in the West. Though the works of Kālidāsa delighted Goethe, the literature taken as a whole has been called artificial, over-ornate, lacking in true feeling, or even an example of wasted and perverted ingenuity. Indians themselves are not always satisfied with it. Thus a modern authority writes: "As a result of the particular demand in the court atmosphere the natural spontaneity of the poet was at a discount. . . . Learning and adaptation to circumstances were given more importance than the pure flow of genius. . . . As a result Sanskrit poetry not only became artificial but followed a traditional scheme of description. . . . The magic of the Sanskrit language . . . also led the poets astray and led them to find their amusement in verbal sonorousness."¹⁵

This judgement, which the author later qualifies, is in part correct. It is, besides, an indication of how deeply modern India has been affected by European æsthetic standards, judged by which much Indian classical literature is indeed artificial. It was written mainly for recitation or performance at court, or for comparatively small circles

of litterati, all well versed in the rigid canons of the literary convention and highly appreciative of verbal ingenuity. In such circumstances it would be futile to expect the native wood-notes of a Clare or the natural mysticism of a Wordsworth. The poets lived in a comparatively static society, and their lives were controlled in detail by a body of social custom which was already ancient and which had the sanction of religion behind it. They were never in revolt against the social system, and Indian Shelleys and Swinburnes are lacking. Most of this literature was written by men well integrated in their society and with few of the complex psychological difficulties of the modern literary man; hence the spiritual anguish of a Cowper, the heart-searchings of a Donne, and the social pessimism of an early T. S. Eliot, are almost entirely absent. Despite its reputation for pessimism in the West, Hindu thought and literature is fundamentally optimistic, and the tragic drama, or the story with an unhappy ending, was not looked on with favour.

The chief raw materials of the Indian poet were love, nature, panegyric, moralizing and story telling. Religious subjects, in the sense of legends of the gods, are common enough, but deep religious feeling is comparatively rare in courtly literature. A few poets, such as Bhartṛhari, wrote occasionally on religious themes with the intensity of deep faith, but for all its mythological trappings and polite invocations to deities classical Sanskrit poetry is predominantly secular. The gods, when they appear, have usually the character of enlarged human beings.

Love was passionately physical, and we have said something of the approach of the Indian poet to the subject in another chapter (p. 171f). As in most European literature of ancient and medieval times, nature was usually treated in its relation to man, and rarely described for its own sake. The phenomena of the seasons, day and night, birds and beasts and flowers, are employed to frame human emotions, or are personified as counterparts of the human subjects of the poet. But throughout the literature a deep love of nature is implicit, especially in Kālidāsa who, for this reason among others, has a higher reputation in the West than any other ancient Indian poet. Panegyrics, in praise of a king and his ancestors, are very numerous and form one of the chief sources of our historical knowledge. The element of moralizing is prominent in the writing of most poets. Kālidāsa was particularly fond of including generalizations of a sententious or moral nature in his verses, and this practice was recognized as one of the legitimate *alaṃkāras* ("adornments") of Sanskrit poetry. Gnomic verses, often of a dry worldly-wise humour, were very popular.

The technique of poetry was thoroughly studied and rules were

laid down in numerous textbooks. The purpose of poetry is usually described as emotive; the emotion aroused, however, is not the pity and terror of Aristotle, but a calmer experience, an æsthetic sensation based on feeling lifted to such a plane that grief is no longer felt as grief, and love no longer as love—according to one definition “impersonalized and ineffable æsthetic enjoyment from which every trace of its component . . . material is obliterated”.¹⁶ The basic *rasas* or “flavours” from which this æsthetic experience should arise are usually classified as eight—love, courage, loathing, anger, mirth, terror, pity and surprise. Theoretically every poem should contain one or more of these flavours.

An important element in Sanskrit poetic theory was *dhvani* (“reverberation”), the suggestion or incantation of words and phrases. Words have their denotations and their connotations, their primary meanings and their undertones, and it is with these latter that the poet has to do. By carefully choosing his words he can make them say far more than their bare meanings and induce a whole series of emotions by a single brief verse. Indian literary philosophers advanced far in this direction and produced theories on the psychology of poetic appreciation which, in broad outline, would not be unacceptable to many modern poets of the West.*

Perhaps the most important tool of the poet was *alaṃkāra*, or ornamentation, which included simile and metaphor, generalization, punning, alliteration of various kinds, and so on. This branch of poetic technique was also worked out in great detail by the theorists, and the free use of ornamentation resulted in poetry of great floridity. This was encouraged by the enormous number of synonyms and homonyms in Sanskrit, and by the very numerous and universally accepted stock epithets, such as “the mine of jewels” (*ratnākara*) for “the sea”, “the unmoving” (*acala*) for “mountain”, “sky-goer” (*khaga*) for “bird”, and “the frail” (*abalā*) for “woman”. The ancient Indian poet would have been quite at home with Pope’s “denizens of air” and “finny tribes”.

The unit of poetry is the stanza, usually grammatically complete in itself. The *mahākāvya*, loosely translated “epic”, often degenerated into a string of verses or groups of verses, linked only by a very slender thread of narrative. In the more ornate courtly literature plot and construction are in general weak, and there is little sense of balance. This is not the case with purely narrative poetry, as in such works as the “Ocean of Story”, the author of which tells his tales

* The most important and original literary theorists were Daṇḍin (p. 442ff) (*Kāvya-darśa*, 6–7th century), Bhāmaha (*Kāvyaālaṃkāra*, 7th century), Ānandavardhana (*Dhvany-āloka*, 9th century), Maṃmaṭa (*Kāvya-prakāśa*, early 12th century), and Viśvanātha (*Sāhityadarpaṇa*, 14th century).

with economy and restraint (p. 429ff). And often, even in the most ornate *kāvya*, the poet will from time to time rise to the occasion with vivid and dramatic description, though it must be admitted that the longer Sanskrit poem is usually prolix and shapeless.

On the other hand the individual verse is balanced and succinct. Single-verse poems, reminiscent of the Persian *rubā'i* or the Japanese *tanka*, were very popular, either standing alone or included in dramas and prose works. Many of these are very beautiful, and make an immediate appeal to the Western reader, even in translation. They were collected in anthologies, of which a number survive and have preserved many lovely verses which would otherwise have been lost.

Metrically Sanskrit poetry was quantitative, and rigidly regulated. The normal stanza was one of four quarters, each of length varying from eight to twenty-one syllables, generally equal and unrhymed. The Epics usually employed the metre called *śloka*, of eight syllables to the quarter, which allowed some scope for variation; but classical poets preferred metres of greater complexity and rigidity, of which many are listed in textbooks on poetics, though only a dozen or so were popular. These metres allowed little or no scope for variation and their syllables were arranged in complicated patterns, usually of great beauty.*

Owing to the structure of Sanskrit, literal translation of classical Indian poetry into English is quite impossible, and we cannot convey the æsthetic effect of a Sanskrit verse. The brief extracts here translated in rhythmic prose give but a faint impression of the rich and closely knit texture of the originals or of the wonderful sonority of the language, which, when well handled, with all the arts of prosody and ornamentation, surely has a splendour unsurpassed by any other language in the world. Classical Indian poetry, like Indian music and art, developed along lines of its own and its canons are not those of the West, but it has its own special merits and beauties.

Indian and European judges alike agree that Kālidāsa was the greatest Sanskrit poet. He probably flourished in the reigns of the emperors Candragupta II and Kumāragupta I (375-455), and thus saw ancient Indian courtly culture at its zenith. Like the murals of Ajantā, his work seems to reflect that culture completely and convincingly. Though deeply imbued in tradition, he carried tradition lightly, and throughout his work his personality breaks through. A few legends are told of him in late sources, but we have no reliable information about his life and character. From his work he seems to have been a happy and gentle man, sympathetic to sorrow, deeply understanding the moods of women and children, and loving flowers

* For further notes on Sanskrit prosody see Appendix, p. 508ff.

and trees, beasts and birds, and the pomp of court ceremonial. He was the author of three dramas (p. 485), two long poems, "The Birth of the War-god" (*Kumārasambhava*) and the "Dynasty of Raghu" (*Raghuvaṃśa*), and two shorter, the "Cloud-messenger" (*Megha-dūta*) and the "Garland of the Seasons" (*Ṛtusamhāra*), as well as of several other works which have not survived.

The "Cloud Messenger" is a work of little over 100 verses, which has always been one of the most popular of Sanskrit poems. Its theme has been imitated in one form or another by several later poets both in Sanskrit and the vernaculars. More than most Indian poems this work has unity and balance, and gives a sense of wholeness rarely found elsewhere. In its small compass Kālidāsa has crowded so many lovely images and word-pictures that the poem seems to contain the quintessence of a whole culture. It describes a yakṣa who dwells in the divine city of Alakā, in the Himālayas. He has offended his master Kubera (p. 313 f), and has been banished for a year to the hill of Rāmāgiri, in the modern Madhya Pradesh. The worst aspect of his exile is his separation from his beautiful wife, whom he has left behind in the mountain city. So, at the beginning of the rainy season, he sees a large cloud passing northward to the mountains, and pours out his heart to it. After a verse or two of introduction the rest of the poem consists of the yakṣa's address to the cloud.

First he tells it the route which it must take to reach the mountains; here Kālidāsa describes the lands, rivers and cities over which it must pass in very beautiful verses. We quote two describing the river Narmadā and the forests on its banks. Notable in the first verse is the bird's-eye-view implied in the simile.

"Stay for a while over the thickets, haunted by the girls of the hill-folk,
then press on with faster pace, having shed your load of water,
and you'll see the Narmadā river, scattered in torrents, by the rugged
rocks at the foot of the Vindhya,
looking like the plastered pattern of stripes on the flank of an elephant.*

"Note by the banks the flowers of the *nīpa* trees, greenish brown, with
their stamens half developed,
and the plantains, displaying their new buds.
Smell the most fragrant earth of the burnt out woodlands,
and as you release your raindrops the deer will show you the way."¹⁷

* The second line of the original of this verse ("press on with faster pace, having shed your load of water") is skilfully alliterated on the consonant *t*, giving an impression of haste to the slow metre and suggesting the patter of raindrops:

*Śhītvā tasmin vanacara-vadhū-bhukta-kuñje muhūrtaṃ,
toyotsarga-drutatara-gatis tatparam vartma tīrṇaḥ,
Revām drakṣyasy upala-viśame Vindhya-pāde viśrñāṃ,
bhakti-cchedair iva viracitāṃ bhūtim aṅge gajasya.*

Then the cloud is told to turn westward and visit the splendid city of Ujjayainī. Kālidāsa cannot long resist the *śṛṅgāra rasa*, the erotic sentiment, and this is evoked by his description of the city,

“where the wind from the Śiprā river prolongs the shrill melodious cry of the cranes,
fragrant at early dawn from the scent of the opening lotus,
and, like a lover, with flattering requests,
dispels the morning languor of women, and refreshes their limbs.

“Your body will grow fat with the smoke of incense from open windows where women dress their hair.
You will be greeted by palace peacocks, dancing to welcome you, their friend.
If your heart is weary from travel you may pass the night above mansions fragrant with flowers,
whose pavements are marked with red dye from the feet of lovely women.”¹⁸

Then, as the cloud nears the Himālayas, it will see the magic city

“where yakṣas dwell with lovely women in white mansions,
whose crystal terraces reflect the stars like flowers.
They drink the wine of love distilled from magic trees,
while drums beat softly, deeper than your thunder.”¹⁹

Then the yakṣa describes his home, and his lovely wife, weak from sorrow and longing. He gives the cloud a message to her, that his love is still constant and that the time of reunion is approaching.

“I see your body in the sinuous creeper, your gaze in the startled eyes of deer,
your cheek in the moon, your hair in the plumage of peacocks,
and in the tiny ripples of the river I see your sidelong glances,
but alas, my dearest, nowhere do I find your whole likeness!”²⁰

“The Birth of the War-god” may be described as a religious poem, but though all its characters are supernatural, and include Śiva himself, the atmosphere of the poem is essentially secular. It begins with a fine description of the Himālayas, from which we quote a few verses. The daring comparison of the chain of mountains to a surveyor’s measuring rod is worthy of John Donne, and gives another example of Kālidāsa’s bird’s-eye-view approach.

“In the northern quarter is divine Himālaya,
the lord of mountains,
reaching from Eastern to Western Oceans,
firm as a rod to measure the earth. . . .

- “There demigods rest in the shade of the clouds
 which spread like a girdle below the peaks,
 but when the rains disturb them
 they fly to the sunlit summits. . . .
- “The hollow canes are filled with the wind
 that bursts from the chasms,
 as though to provide an ostinato
 to the songs of heavenly minstrels. . . .
- “All through the night phosphorescent herbs
 shine in the caverns with their glimmering radiance,
 and light the loves
 of hill-women and their paramours. . . .
- “And the wind forever shaking the pines
 carries the spray from the torrents of the young Ganges
 and refreshes the hunting hillman,
 blowing among his peacock plumes.”²¹

The poem, which is a long one, describes the courtship and marriage of Śiva and Pārvatī (p. 309), and the birth of their son, Kumāra or Skanda, the war-god. As he grows to manhood Kumāra is appointed general of the gods, and he leads them forth to battle with the terrible demon Tāraka, who has long been afflicting the whole universe. Tāraka hears of their approach, musters his forces, and goes out to meet them; but terrible omens greet the army of demons. Here Kālidāsa embarks on a remarkable description, which reminds us of the more macabre work of Gustave Doré.

- “A fearful flock of evil birds,
 ready for the joy of eating the army of demons,
 flew over the host of the gods,
 and clouded the sun.
- “A wind continually fluttered their umbrellas and banners,
 and troubled their eyes with clouds of whirling dust,
 so that the trembling horses and elephants
 and the great chariots could not be seen.
- “Suddenly monstrous serpents, as black as powdered soot,
 scattering poison from their upraised heads,
 frightful in form,
 appeared in the army’s path.
- “The sun put on a ghastly robe
 of great and terrible snakes, curling together,
 as if to mark his joy
 at the death of the enemy demon.

- “And before the very disc of the sun
jackals bayed harshly together,
as though eager fiercely to lap the blood
of the king of the foes of the gods, fallen in battle.
- “Lighting heaven from end to end,
with flames flashing all around,
with an awful crash, rending the heart with terror,
a thunderbolt fell from a cloudless sky.
- “The sky poured down torrents of red-hot ashes,
with which were mixed blood and human bones,
till the flaming ends of heaven were filled with smoke
and bore the dull hue of the neck of an ass.
- “Like the thundered threat of the angry death-god
a great crash broke the walls of the ears,
a shattering sound, tearing the tops of the mountains,
and wholly filling the belly of heaven.
- “The host of the foe was jostled together.
The great elephants stumbled, the horses fell,
and all the footmen clung together in fear,
as the earth trembled and the ocean rose to shake the mountains.
- “And, before the host of the foes of the gods,
dogs lifted their muzzles to gaze on the sun,
then, howling together with cries that rent the eardrums,
they wretchedly slunk away.”²²*

The poem ends with the death of Tāraka in single combat with Kumāra.

We have no space to discuss the rest of Kālidāsa's poetry, all of which is of fine quality. “The Dynasty of Raghu” especially contains many passages of great beauty, including a concise version of

* The mastery of language in the last three stanzas quoted is so remarkable that it must impress even the reader who knows no Sanskrit. With brilliant use of assonance and alliteration Kālidāsa has wedded sound to sense in a way rarely achieved in the literature of the world.

*Nirghāta-ghoṣo giri-śrṅga-śātano
ghano 'mbarāśā-kuharodarambharīḥ
babhūva bhūmnā śruti-bhitti-bhedanaḥ,
prakopi-Kāl'-ārjita-garji-tarjanaḥ.*

*Skhalan-mahebhāṃ prapatat-turaṅgamaṃ
parasparāśliṣṭa-janaṃ samantataḥ.
prakṣubhyad-ambhodhi-vibhinna-bhūdharād
balaṃ dviṣo 'bhūd avani-prakampāt.*

*Ūrdhvikṛtāsyā ravi-datta-dr̥ṣṭayah
sametya sarve sura-vidviṣaḥ puraḥ,
śvānaḥ svareṇa śravaṇānta-śātina
mitho rudantaḥ karuṇena nirayayuḥ.*

the story of Rāma, but the work is apparently incomplete. "The Garland of the Seasons" describes the six seasons of the Hindu year in relation to *śṛṅgāra*, the erotic sentiment, but though charming it is slighter and less impressive than the rest of Kālidāsa's work.

Many other poets after Kālidāsa, wrote mahākāvya, or long courtly "epics", but none so ably as he. Kumāradāsa's "Rape of Sītā" (*Jānakī-haraṇa*) continues his tradition, while Bhāravi's "Arjuna and the Kirāta" (*Kirātārjunīya*), describing an encounter of the hero Arjuna and the god Śiva, in the guise of a Kirāta or wild mountaineer, is somewhat more florid. Bhaṭṭi, of the 7th century, wrote a remarkable poem on the story of Rāma, usually known as "Bhaṭṭi's Poem" (*Bhaṭṭikāvya*), containing passages of real beauty, as an exercise to illustrate rules of grammar. Even more ingenious was the 7th-century poet Māgha, who wrote a long poem on an incident in the life of Kṛṣṇa, the "Slaying of Śiśupāla" (*Śiśupāla-vadha*). Though the work contains many fine stanzas the story is so badly told that the poem as a whole has no semblance of unity. In the nineteenth canto, which describes the battle between Kṛṣṇa and his enemy, Māgha thought fit to display his mastery of language by inserting many stanzas of amazing ingenuity. We give an example of an *ekākṣara* stanza, employing only one consonant throughout:

*Dādado dudda-dud-dādī
dādādo dūda-dī-da-doh
dud-dādam dadade dudde
dad'-ādada-dado 'da-daḥ.*

This stanza, using very rare and obscure words, and exceedingly elliptical, may be translated as follows:

"The giver of gifts, the giver of grief to his foes,
the bestower of purity, whose arm destroys the givers of grief,
the destroyer of demons, bestower of bounty on generous and miser
alike,
raised his weapon against the foe."²³

The following is a *dvyaḥṣara*, containing only two consonants:

*Krūrāri-kārī kor eka-
kārakah kārīkā-karah
korakākāra-karakah
karīrah karkaro 'rka-ruk.*

"The destroyer of cruel foes, the only creator of the world,
bestower of woes on the wicked, with hands like the buds of lotuses,
the overthrower of elephants,
fierce in battle, shone like the sun."²⁴

The next stanza is called *sarvatobhadra* ("valid all ways"), and is a complicated mixture of syllabic palindrome and acrostic. Each quarter-stanza is a palindrome; the first four syllables of the first quarter are the same as the first syllables of each quarter, and in the same order; the first four syllables of the second quarter are the same as the second syllables of each quarter, and so on. This verse is positively startling in its ingenuity, and when read in the original produces an impression resembling that of complex polyphony.

*Sakāra-nān'-āra-kāsa-
kāya-sāda-da-sāyakā
ras'-āhavā vāha-sāra-
nādavāda-da-vādanā.*

"His army was eager for battle,
whose arrows destroyed the bodies of the varied hosts of his brave
enemies.
Its trumpets vied with the cries
of the splendid horses and elephants."²⁵

Finally a stanza called *gatapratyāgatam* ("gone and come back"). It is a perfect syllabic palindrome.

*Taṃ Śriyā ghanayā 'nasta-
rucā sāratayā tayā
yātayā tarasā cāru-
stanayā 'naghay' āśritam.*

"He who was eagerly and close embraced
by the fair-bosomed Śrī, the sinless goddess,
of never-failing beauty, and endowed
with every excellence."²⁶

After Māgha longer poems often became mere displays of verbal ingenuity. The narrative became progressively less important, and the style progressively more ornate, though there were important exceptions. The climax of the tendency came with the *dvyāśraya-kāvya*, telling two stories simultaneously, by deliberately utilizing the ambiguity of words and phrases. A well-known example of this genre is the *Rāmacarita* ("Deeds of Rāma") of the 12th-century poet Sandhyākara, which may be read as applying either to the legendary Rāma of Ayodhyā or to the historical king Rāmapāla of Bengal, who was the poet's contemporary and patron. Achievements like this are not to be disparaged, but they make little appeal to the European reader and are quite untranslatable.

A Persian Prince and Princess. Ajantā

Fighting Bulls. Ajantā

Seated Girl. Mural Painting, Ajantā. Gupta Period

The best things in medieval poetry are to be found in the single-stanza poems, of which there are many collections, either by one or many hands. The finest poet in this genre was Bhartṛhari, thought to have lived in the 7th century, who left no long poems, but only three centuries of separate stanzas on the subjects of worldly wisdom, love and renunciation respectively. These are masterpieces of concise expression, and, unlike most Sanskrit poems, tell us much about the personality of the author. We quote first two stanzas in an amusingly sententious vein.

“You may boldly take a gem from the jaws of a crocodile,
you may swim the ocean with its tossing wreath of waves,
you may wear an angry serpent like a flower in your hair,
but you’ll never satisfy a fool who’s set in his opinions!

“You *may*, if you squeeze hard enough, even get oil from sand,
thirsty, you *may* succeed in drinking the waters of the mirage,
perhaps, if you go far enough, you’ll find a rabbit’s horn,
but you’ll never satisfy a fool who’s set in his opinions!”²⁷

In his erotic verses Bhartṛhari often shows an undercurrent of dissatisfaction, as though trying to convince himself that love is not a futile waste of time after all. In the midst of his amours he feels the call of the religious life, and in one remarkable stanza he indulges in striking punning to this effect. The obvious meaning is:

“Your hair well combed, your eyes reaching to your ears,*
your mouth filled with ranks of teeth that are white by nature,
your breasts charmingly adorned with a necklace of pearls,
slim girl, your body, though at rest, disturbs me.”

But this might also be fancifully translated as:

“Your hair self-denying, your eyes understanding the whole of scripture,
your mouth full of groups of naturally-pure brāhmaṇs,
your breasts lovely from the presence of emancipated souls,
slim girl, your body, though free from passion, disturbs me.”²⁸

This is the sort of thing which most critics of Sanskrit poetry object to; but Bhartṛhari might justify his punning here, for by employing words with religious connotations he has given expression to his own divided mind. This is very forcibly expressed in another stanza, which we quote. “The forest” implies the life of the hermit.

* This is one of the conventions of poetry. The eyes of a pretty girl are so long that their corners almost touch her ears.

"What is the use of many idle speeches!

Only two things are worth a man's attention—
the youth of full-breasted women, prone to fresh pleasures,
and the forest."²⁹

It would seem that in the end Bhartṛhari gave up the love of women for the love of God, though the word which we here translate "God" is the impersonal Brahman (p. 250).

"When I was ignorant in the dark night of passion
I thought the world completely made of women,
but now my eyes are cleansed with the salve of wisdom,
and my clear vision sees only God in everything."³⁰

Bhartṛhari's religious experience was intense enough to produce the following splendid pæan, in which he addressed the five elements of Hindu physics.

"Oh Earth, my mother, Air, my father, Oh Fire, my friend,
Water, my kinsman, Space, my brother,
here do I bow before you with folded hands!
With your aid I have done good deeds and found clear knowledge,
and, glorious, with all delusion past, I merge in highest godhead."³¹

An erotic poet with none of Bhartṛhari's doubts was Amaru, also probably of the 7th century. His stanzas on love are often voluptuous, but they can be humorously tender, and always show a sound understanding of feminine psychology. Amaru loved to describe a poignant moment in a human relationship in a single verse, in which the reader is given only the climax of the story, the reconstruction of the rest being left to his imagination.

"'We'll see what comes of it,' I thought, and hardened my heart against her.

'What, won't the villain speak to me?' she thought, flying into a rage.

And there we stood, sedulously refusing to look one another in the face,
until at last I managed an unconvincing laugh, and her tears robbed me of my resolution."

. . . .

"'Why are your limbs so weak, and why do you tremble?

And why, my dear,' asked her lord, 'is your cheek so pale?'

The slender girl replied, 'It's just my nature!'

and turned away and sighed, and let loose the tears that burdened her eyelids."

. . . .

“Fool that I was, why didn't I clasp the lord of my life to my neck?
 Why did I turn my face away when he wanted to kiss me?
 Why did I not see? Why did I not speak?’ So, when love is first
 awakened,
 a girl is filled with remorse as she thinks of her childish shyness.”³²

We cannot devote much more space to the many brief poems of the Middle Ages, which are so full of charm and skill, and which need a competent translator to introduce them to the West. In passing, however, we would quote two stanzas contained in the prose work called “The Deeds of Harṣa”, by the 7th-century writer Bāṇa (p. 446ff), which are sung by a bard at dawn to rouse his companions. In our opinion these neglected verses are among the finest in Indian literature. Ostensibly they describe a great stallion waking from sleep, but it may be that the poet remembered the cosmic symbolism of the horse in Vedic times (p. 24f), and intended to speak of the universal in terms of the particular. Bāṇa had evidently carefully studied his subject, which he describes almost anatomically, in words which have few overtones of meaning; but he succeeds in conveying his own deep delight in the horse by subtle alliterative effects, by the heavy metre, which he handles with masterly skill, and by the implicit contrast of the tiny piece of chaff in the last line.

“He stretches his hind-leg, and, bending his spine, extends his body upwards.

Curving his neck, he rests his muzzle on his chest, and tosses his dust-grey mane.

The steed, his nostrils ceaselessly quivering with desire of fodder, rises from his bed, gently whinnies, and paws the earth with his hoof.

“He bends his back and turns his neck sideways, till his face touches his buttock,

and then the horse, the curls matted about his ears,
 rubs with his hoof the red corner of his eye, itching from sleep,
 his eye, struck by his dewdrop-scattering mane, waving and tossing,
 his eye, to the point of whose quivering eyelash there clings a tiny
 fragment of chaff.”^{33*}

* We quote the Sanskrit, in the hope that some of Bāṇa's wonderful sound effects, which seem so well to fit the sense of his verses, may be recognized.

*Pascād aṅghriṃ prasārya, trika-nati-vitataṃ, drāghayitvāṅgam uccair,
 āsajyābhugna-kaṇṭho mukham urasi, saṭā dhūli-dhūmrā vidhūya,
 ghāsā-grāsābhilāṣād anavarata-calat-protha-tuṇḍas turaṅgo,
 mandam śabdāyamāno, vilikhati, śayanād utthitah, kṣmāṇi khurena.*

*Kurvann ābhugna-prṣṭho mukha-nikaṣa-kaṭiḥ kandharām ā tiraścim
 lolenāhanyamānaṃ tuhina-kaṇa-mucā cañcatā kesareṇa
 nidrā-kaṇḍū-kaṣāyaṃ kaṣati, nīvidita-śrotra-śuktis, turaṅgas
 tvangat-pakṣmāgra-lagna-pratanu-busa-kaṇam koṇaṃ akṣṇaḥ khureṇa.*

Before leaving this style of poetry we should mention the Kashmīrī Bilhāṇa, of the 11th and 12th centuries, whose "Fifty Stanzas of the Thief" (*Caurapañcāśikā*), purporting to describe the secret love of a bold housebreaker and a princess, are full of intense emotion recollected without tranquillity. Each begins with the words "Even today".

"Even today I can see her, her slender arms encircling my neck,
my breast held tight against her two breasts,
her playful eyes half-closed in ecstasy,
her dear face drinking mine in a kiss.

"Even today, if this evening
I might see my beloved, with eyes like the eyes of a fawn,
with the bowls of her breasts the colour of milk,
I'd leave the joys of kingship and heaven and final bliss."³⁴

In a class of its own is Jayadeva's "Song of the Cowherd" (*Gīta Govinda*), written in Bengal in the 12th century. This is a series of dramatic lyrics intended for singing, and describes the love of Kṛṣṇa for Rādhā and the milkmaids (p. 304f). The poem is still sung at the festivals of the Bengālī Vaiṣṇavite sects, but though it begins with a beautiful invocation to the ten incarnations of Viṣṇu its inspiration to the Western mind seems rather erotic than religious. Unlike almost all other classical Sanskrit poetry Jayadeva's lyrics are rhymed, and look forward to the verse forms of vernacular literature. Each commences with an introductory stanza in one of the more usual Sanskrit metres, and the final stanza of each introduces the poet's name. The verses which we translate describe Kṛṣṇa's longings when separated from his beloved Rādhā. "The foe of Madhu" (a demon killed by Kṛṣṇa) and Hari are epithets of the god.

"Here I am dwelling. Go now to Rādhā,
console her with my message, and bring her to me.'
Thus the foe of Madhu commissioned her friend,
who went in person, and spoke to Rādhā thus:

"When the breeze blows from the Southern Mountains,
and brings the Love-god with it,
when masses of flowers burst forth
to rend the hearts of parted lovers,
he is grieved at separation from you, decked with his forest garland.

"Even the cool-rayed moon inflames him,
he is as if dead.
Struck by the arrows of love
he complains most wretchedly.
He is grieved . . .

- “When the swarming bees are murmuring
 he closes fast his ears.
 His heart is clenched by parting,
 he spends his nights in fever.
 He is grieved. . . .
- “He dwells in the depths of the forest,
 he has left his lovely home.
 He tosses in sleep on the earth
 and much he murmurs your name.
 He is grieved. . . .’
- “When the poet Jayadeva sings,
 through this pious description
 of the deeds of the parted lover,
 may Hari arise in hearts full of zeal.
 He is grieved at separation from you, decked with his forest gar-
 land.”³⁵*

Narrative Poetry

As well as various smaller collections there exists in various re-
 censions a large series of popular stories, the *Bṛhatkathā* (“Great
 Story”), boxed one within the other in the manner of “The
 Thousand and One Nights”. The most famous of these versions is
 Somadeva’s “Ocean of Story” (*Kathā-sarit-sāgara*), written in the
 11th century in easy but polished verse. The stories are told with
 comparative simplicity and directness, and with many touches of
 humour and pathos. We quote from the tale of the thief and the
 merchant’s daughter. A wealthy merchant, Ratnadatta, has no sons,
 and his only daughter, Ratnāvati, much loved and pampered by her
 father, refuses to marry, despite the pleading of her parents. Mean-
 while a desperate thief has been captured by the king, and is led
 through the streets to execution by impalement.

- “To the beat of the drum the thief was led
 to the place of execution,
 and the merchant’s daughter Ratnāvati
 sat on the terrace and watched him.
 He was gravely wounded and covered with dust,
 but as soon as she saw him she was smitten with love.

* The rhyme scheme varies from lyric to lyric. Here the second and fourth quarters
 end with a rhyme of two syllables, while the first and third quarters of each stanza end
 with the same syllable. The first and third quarters end in *e* throughout the poem. The
 refrain applies equally to the love of Kṛṣṇa for Rādhā and the love of God for the soul.
 We quote the last verse so that the reader may have some idea of the mellifluousness
 of the original:

*Bhaṇati kavi-Jayadeve
 virahi-vilasitena
 manasi rabhasa-vibhave
 Harir udayatu sukytena.
 Tava virāhe vanamālī sakhi sīdati.*

"Then she went to her father Ratnadatta, and said:

'This man they are leading to his death

I have chosen for my lord!

Father, you must save him from the king,

or I will die with him!'

And when he heard, her father said:

'What is this you say, my child?

You've refused the finest suitors,

the images of the Love-god!

How can you now desire

a wretched master-thief?'

"But though he reproached her thus

she was firm in her resolve,

so he sped to the king and begged

that the thief might be saved from the stake.

In return he offered

the whole of his great fortune,

but the king would not yield the thief

for ten million pieces of gold,

for he had robbed the whole city,

and was brought to the stake to repay with his life.

"Her father came home in despair,

and the merchant's daughter

determined to follow

the thief in his death.

Though her family tried to restrain her

she bathed,

and mounted a litter, and went

to the place of impalement,

while her father, her mother and her people

followed her weeping.

"The executioners placed

the thief on the stake,

and, as his life ebbed away,

he saw her come with her people.

He heard the onlookers speaking

of all that had happened,

For a moment he wept, and then,

smiling a little, he died.

At her order they lifted the corpse

from the stake, and took it away,

and with it the worthy merchant's daughter

mounted the pyre."³⁶*

* Stories such as this puzzle the social historian. If the texts on the Sacred Law have any relation to real life it is quite incredible that a girl of good class in the 11th century should have been given such freedom by her parents, or should even have thought of legally marrying a despised outcaste. The story probably looks back to a much earlier time, when social relations were very much freer.

The modern European reader would find this a conclusive ending to a tale of old, unhappy, far-off things; but to the Indian of medieval times such an ending would have been quite unsatisfactory, so a *deus ex machina* was brought in in the form of the god Śiva, who was so impressed by the girl's love and faithfulness that he restored the corpse of the dead thief to life. He reformed his ways and became the king's general, and the two were married and lived happily ever after.

In the category of narrative poems we must include Kalhaṇa's great chronicle of Kashmīr "The River of Kings" (p. 44), and several other medieval works of comparatively small literary value. Midway between the purely narrative poem and the courtly "epic" are a number of historical works partly descriptive, partly panegyric, and partly sober history. The most famous of these is "The Deeds of Harṣa", by Bāṇa, written in ornate poetic prose, which is discussed below (p. 447ff). Of some literary merit is "The Deeds of Vikramāṅka" (*Vikramāṅkadevacarita*), of Bilhaṇa (p. 428), dealing with the life and adventures of the great Cālukya emperor Vikramāditya VI (c. 1075-1125). Another example of this type is the *Rāmacarita*, already mentioned. Yet another is the work of a Jaina monk, Naya-candra Sūri, the *Hammīra-mahākāvya*, which is among the latest important works of Sanskrit literature. This beautiful but little known poem deals with the life of Hammīra, the last of the dynasty of the Cāhamāṇas, who was defeated and killed by the Delhī sultan Alā'-ud-dīn Khaljī in 1301, after a long siege of his capital Raṇasthambhapura (in the vernacular, Ranthambhor). As Hammīra was slain with all his followers the poet was forced by his theme somewhat to flout convention, but he managed to retain a semblance of the happy ending demanded by tradition by concluding his work with a description of the entry of Hammīra and his followers into heaven. Much of the poem, though not without beauty, is irrelevant to the main theme, but the description of the king's last days is direct and forceful.

Towards the end of the poem Naya-candra introduces a remarkable episode. We cannot say whether he consciously intended the beautiful dancer who died so tragically as a symbol of the courtly culture which fell to the invader, but it is thus that the passage, occurring so portentously just before Hammīra's death, strikes the reader. In the course of the siege a temporary truce has been arranged, and the Rājputs are making the most of it. On the battlements a musical entertainment is taking place, and Hammīra's favourite dancer, Rādhādevī, is performing for the king and his courtiers. A long bowshot away, on the other side of the moat, sits the sultan, also watching the dance with interest. He is referred to in the poem as the Lord of the

Śakas, a term at this time applied to all the invaders of the North-West. The first part of our extract is exceedingly florid, and full of untranslatable puns, but the style suddenly becomes simple and terse when the episode moves to its climax.

“In time the drummers beat their drums, the lutanists plucked their lutes,

the flautists blew their flutes.

Their voices in tune with the shrill flutes, the singers sang the glory and fame of the brave Hammīra. . . .

Then, the vine of her body entrancing her lovers, awakening passion with the glance of her half-closed eyes, to delight the hearts of the courtiers, came Rādhādevī the dancer, arrayed for the dance.

“The quivering buds of her fingers moved in the dance like tendrils of a vine, thrilling with passion. . . .

As the tips of her fingers bent, as though in a circle, with her grace and delicate beauty all other girls seemed her slaves. The moon, in the guise of the ring that trembled from the tip of her ear, said: ‘Your face is my likeness, the delusion even of sages!’

And as she danced she stirred the hearts of the young men watching—the hearts which lay like motes of camphor under her feet. . . .

With her gestures the necklace trembled on the tips of her breasts like a lotus twined in the beak of a swan.

When her body bent back like a bow in the dance like a bowstring the braid of her hair stretched down to her heel. . . .

“And as she danced, at every beat of the rhythm, she turned her back on the Śaka king below.

“Then in fury of soul the Lord of the Śakas spoke to his chamberlain: ‘Is there any bowman who can make her his mark?’

His brother said : ‘Sire, there is he whom you formerly threw into prison, Uḍḍānasimha—he is the only man who can do it!’

At once the Śaka king had him brought, and struck off his fetters, and arrayed the traitor finely, with double gift of affection.

And thus apparelled he took the bow which none but he could draw, and the sinner shot her, as a hunter shoots a doe.

“At the stroke of the arrow she fainted and fell in the moat, as lightning falls from heaven.”³⁷*

The Drama

The origin of the Indian theatre is still obscure. It is certain, however, that even in the Vedic period dramatic performances of some kind

* The simile is not unduly exaggerated, as the dancer was covered with jewellery, which glittered in the sunlight.

were given, and passing references in early sources point to the enactment at festivals of religious legends, perhaps only in dance and mime. Some writers have found elements in common between the Indian and the classical Greek theatre. The curtain at the back of the stage was called *yavanikā*, a diminutive form of the name by which the Greeks were generally known in India. One play at least, "The Little Clay Cart" (p. 441), has a superficial resemblance to the late Greek comedy of the school of Menander. We cannot wholly reject the hypothesis that Greek comedies, acted at the courts of the Greco-Bactrian kings of N.-W. India, inspired unknown Indian poets to develop their own popular stage into a courtly art form.

The surviving Sanskrit dramas are numerous and varied, ranging from short one-act playlets to very long plays in ten acts. They were normally performed by troupes of professionals of both sexes, but amateur dramatics were not wholly unknown, since we have occasional references to kings and the ladies of the harem performing dramas in the palace. There was no regular theatre, though it has been suggested that one of the caves of Rāmgarh (p. 185) was specially adapted for theatrical performances. Normally dramas were performed privately or semi-privately in palaces or the homes of the rich, or were given public showing in temple courts on days of festival.

A curtain (*yavanikā*) divided the stage (*raṅga*) from the back-stage (*nepathya*), and through this the actors made their entrances. There was no curtain between stage and auditorium. The drama was performed without scenery and with a minimum of properties; the absence of both was made up for by the highly developed gesture language of the dance, which we have discussed elsewhere (p. 385). Every part of the body was used to help tell the story, and the well-trained audience recognized from conventional movements of hands, limbs and features that the king was riding in his chariot, or that the heroine was caressing her pet fawn. The splendid attire of the actors was regulated by convention, so that heroes, heroines, gods, demons, villains, and so on were immediately recognizable.

The drama regularly began with an invocation to one or more of the gods, and a prologue, in which the chief actor and stage manager (*sūtradhāra*) humorously discussed with his wife, the chief actress, the occasion of the performance and the nature of the play to be performed.* The main dialogue of the play was in prose, but this was freely interspersed with verses, which were usually declaimed or intoned, but not sung. In this ancient Indian taste differed from that of

* This convention of the Indian stage was known to Goethe from Sir William Jones' translation of *Śakuntalā*, and was adapted by him for the prologue of *Faust*.

present-day India, which demands many songs in plays and films. The classical unities were not observed; years in time and a thousand miles in space might divide one scene from the next; but within the act unity of time and place was demanded. If in this respect the Indian dramatic convention differed from that of classical Europe, it agreed in forbidding the portrayal of acts of violence on the stage, though this and other rules were sometimes ignored. The act was often preceded by a prelude (*praveśaka*), in which one or two characters set the scene, and described what had gone before.

As in literature generally, so in the theatre Indian convention allowed no tragedy. Tragic and pathetic scenes were common enough, but endings were almost invariably happy. From the European point of view the insistence on the happy ending often led to the unnatural forcing of the plot. But if he rejected tragedy the ancient Indian playgoer delighted in melodrama and pathos. Though the emotion which the Indian writer sought to arouse was theoretically a sublimated one (p. 417), in fact the Sanskrit drama contains so many melodramatic scenes that the emotional Indian audience must often have been moved to tears. Noble heroes are led to execution for crimes they did not commit, declaiming their innocence to their sorrowing wives and children, to be saved from the stake at the last moment. Unhappy wives are unjustly expelled from their homes by their husbands. Long-lost children are reunited with their parents in the final act. Whatever the theorists, beginning with Bharata (p. 382), may have said, the sentiment of the Indian drama was warm and living, sometimes a little reminiscent of that of more popular English authors of the last century.

Like Greek and Elizabethan dramatists Indian writers usually borrowed their plots from earlier sources, often adapting them freely in the process. Legends of the gods and ancient heroes formed an inexhaustible mine of dramatic material. Other plays were written around popular tales of a secular type. There are also dramas of statecraft, based very freely on stories of historical kings of the past, and light comedies of harem intrigue, wherein the hero, a king, succeeds in pacifying the chief queen, who has set her heart against the promotion of the heroine, a servant girl (usually a princess in disguise), to queenly status and her husband's bed. There are also allegorical dramas, in which the characters are personified virtues and vices, and there are a few surviving examples of farces. Plays were classified by the theorists according to style and length into over a dozen categories.

The hero (*nāyaka*) and heroine (*nāyikā*) are inevitable characters in most types of drama, as is the villain (*pratināyaka*). An interesting

stock character is the *vidūṣaka*, who provides comic relief; he is an ugly and misshapen brāhmaṇ, the loyal friend of the hero, but invariably a figure of fun. Another stock character, occurring in one or two extant dramas and noted by the theorists, is the *viṭa*, the cultured but rather shallow man of the world who befriends the hero, and somewhat resembles the parasite of classical Greek comedy.

The earliest known dramas to have survived are fragments of plays by Aśvaghōṣa (p. 415), preserved in manuscripts found in the desert sands of Central Asia. The oldest complete plays are probably those attributed to Bhāsa, which seem to be earlier than those of Kālidāsa, though there is no complete unanimity of experts on this point. Bhāsa's thirteen surviving plays include several works of great merit, notably "The Vision of Vāsavadattā" (*Svapnavāsavadattā*) and "Yaugandharāyaṇa's Vows" (*Pratijñāyaugandharāyaṇa*). Bhāsa also wrote a number of short dramas based on epic stories in simple and vigorous style. Nowadays his plays are often the first introduction of the student of Sanskrit to dramatic literature. He excelled in portraying the heroic sentiment, and ably individualized his characters. More than once he broke the rules of later dramatic theory by permitting acts of violence on the stage.

As in English literature so in Sanskrit, the greatest poet was also the greatest dramatist. Three plays of Kālidāsa have survived: "Mālavikā and Agnimitra", a comedy of harem intrigue, its scene set in the Śuṅga period; "Urvaśi Won by Valour" (*Vikramorvaśi*), telling the ancient story of the love of Purūravas and Urvaśi (p. 405ff); and "The Recognition of Śakuntalā" (*Abhijñānaśakuntala*). At all times the last has been reckoned Kālidāsa's masterpiece, and merits special consideration. The plot is set in the days of legend, when gods and men were not so far apart as they later became. We give an almost complete translation of the fifth act, with a summary of the rest of the play.

The play opens with King Duṣyanta chasing the deer in the neighbourhood of a forest hermitage. He alights from his chariot to pay homage to the chief of the hermits, the sage Kaṇva. Kaṇva is not at home, but the king meets his foster-daughter, Śakuntalā, the illegitimate child of the nymph Menakā (p. 317), who runs on to the stage harassed by a bee, and is freed from its attentions by the gallant King. Naturally he falls in love with her, and with due modesty she shows that she returns his affection. The second act shows Duṣyanta in the throes of love. He cannot press his suit in the absence of Śakuntalā's foster-father, so he remains in the neighbourhood of the hermitage, ostensibly to defend it from wild elephants and demons. In the third act Śakuntalā is languid and sick with love. She confesses her feelings to her two friends, Anasūyā and Priyaṃvadā, who persuade her to

write a letter to the King. As she is writing, the King, who has heard everything from a nearby thicket, comes on the scene, and the two friends withdraw. He gives Śakuntalā a ring, and, by plighting their troth, they are married by the *gāndharva* rite (p. 168).

In the fourth act Duṣyanta has been recalled to his capital by affairs of state, leaving Śakuntalā behind. Kaṇva is still away. Meanwhile a great and irascible hermit, Durvāsas, visits the hermitage, and, as a result of a fancied slight, he curses Śakuntalā, saying that she will be forgotten by her husband until he sees the ring he gave her. Meanwhile Kaṇva returns. He knows already of what has happened, and decides to send the now pregnant Śakuntalā to the King. In a scene of great pathos she takes leave of her foster-father and her friends, and sets out for the capital in the care of two hermits and an elderly hermit-woman, Gautamī. The fifth act shows us the court of Duṣyanta. Śakuntalā, veiled, is ushered in with her attendants. She reminds the King of their love, and the attendants testify to her words; but the curse of Durvāsas has effaced all memory of her from the King's mind, and he does not recognize her.

GAUTAMĪ. Child! Put your modesty on one side a minute and take off your veil. Then His Majesty will recognize you. (*She does so.*)

THE KING (*looking at Śakuntalā, aside*).

This shape of untarnished beauty is offered me.

I ponder, whether or not I really wed her.

I am like a bee in a jasmine wet with the dawn dew—

I cannot now enjoy her, nor can I leave her.

(*He remains deep in thought.*)

THE DOORKEEPER (*aside*). How His Majesty respects the Sacred Law! Who else would think twice about a beauty so easily come by?

ŚĀRŔGARAVA (one of the ascetics). Your Majesty, why are you so silent?

THE KING. Hermits, I've been racking my brains, but I've no recollection whatever of marrying this lady. How can I accept her, . . . especially when she shows such obvious signs of pregnancy?

ŚAKUNTALĀ (*aside*). His Majesty doubts that we were ever married! What has become of my high-soaring hopes?

ŚĀRŔGARAVA. So you won't take her!

The sage indeed deserves your scorn,
for he respects his outraged daughter,
he gives to you the wealth you stole from him,
and treats a robber as an honest man!

ŚĀRADVATA (the other ascetic). That's enough, Śārṅgarava! Śakuntalā, we've said all we can say, and His Majesty has spoken! Now it's up to you! You must say something that will convince him.

ŚAKUNTALĀ (*aside*). When his passion has sunk to such depths what's

the good of reminding him of it! The only thing I'm sure of is that I'm to be pitied! (*Aloud.*) Your Majesty! (*Her voice drops to an undertone.*) Even though you doubt your marriage to me, this isn't the way you ought to receive me. I'm a girl who is naturally open-hearted. Is it right that you should make promises to me at the hermitage and then deceive me, and now use such harsh words to throw me aside?

THE KING (*putting his hands to his ears*). Heaven forbid!

Why do you try to sully your kin
and bring me to ruin,
as a river dashing against its banks
sullies its water and fells the tree on the shore?

ŚAKUNTALĀ. All right! If you really think I'm another man's wife I'll clear up your doubts by this token!

THE KING. That's a good idea!

ŚAKUNTALĀ (*feeling her ring-finger*). Oh dear! Oh dear!! The ring isn't on my finger! (*She looks at Gautamī in distress.*)

GAUTAMĪ. The ring must have slipped off your finger while you were bathing.

THE KING (*smiling*). There's a well-known saying—"A woman always has her wits about her"!

ŚAKUNTALĀ. Fate's against me again! One thing more I want to say.

THE KING. Very well! I'll listen!

ŚAKUNTALĀ. One day when we were in the bower of creepers you had a lotus leaf filled with water in your hand.

THE KING. I'm listening.

ŚAKUNTALĀ. Then my pet fawn Dīrghāpaṅga came up, and you held out the water and tried to get him to come to you, and said tenderly that he should have the first drink, but he wouldn't come near your hand because he didn't know you. So I held him, and he took the water from me, and you laughed and said, "Everyone trusts his own kind—after all, you're both children of the forest!"

THE KING. Those are the sort of sweet and lying phrases with which scheming women fool men of the world!

GAUTAMĪ. Good sir, you shouldn't say such things. This girl was brought up in a hermitage, and she knows nothing of deceit.

THE KING. Old woman!

Even in birds and beasts the female needs no lessons in deceit!

How much less she who has the power of reason!

Cuckoos, before they take to flight,

make sure that other birds will rear their chicks!

ŚAKUNTALĀ (*angrily*). You wretch! You judge me by the measure of your own heart! Was there ever a bigger hypocrite? You, in your cloak of righteousness—you're like a well covered over with grass!

THE KING (*aside*). Her anger seems quite genuine and makes me have second thoughts.

She must think my soul is vile in its forgetfulness,
and in not acknowledging our secret love.
At the knitting of the brows of her eyes red with anger
the bow of the Love-god is snapped in two.

(*Aloud*). Good woman. The movements of King Duṣyanta are common knowledge, and nobody knows anything about this.

ŚAKUNTALĀ. So be it! Here am I, turned into a wanton, and all because I trusted the race of Pūru, and fell into the clutches of a man who had honey on his tongue and poison in his heart. (*She covers her face with the end of her robe and weeps.*)

ŚĀRŅGARAVA. So you have to suffer for your own folly, when you don't keep a check on your impulses.

One should think hard before making love,
especially in secret.
Friendship to those whose hearts we know not
soon turns to hatred.

THE KING. What, do you trust this lady enough to attack me with your censorious words?

ŚĀRŅGARAVA (*scornfully*). You hear things upside down!

The word of one who from her birth
has learnt no guile carries no weight at all,
but they who have mastered the science of deceit
have power to speak words of authority.

THE KING. Honest sir, if for the sake of the argument I admit your accusation, tell me what good it would do me to deceive her.

ŚĀRŅGARAVA. You'd reap your own ruin.

THE KING. And surely it's unbelievable that a king of the line of Pūru should seek his own ruin?

ŚĀRADVATA. Śārṅgarava, what's the use of arguing with him? We've carried out the Teacher's command, now let's go home. (*To the King.*)

Here is Your Lordship's wife—
leave her or accept her.
It is said that the husband's power
over the wife is all-embracing.

Gautamī, let's go! (*They make for the door.*)

ŚAKUNTALĀ. Oh, how I've been cheated by this deceiver! You mustn't leave me! (*She follows them.*)

GAUTAMĪ. (*pausing.*) Look, Śārṅgarava, my child Śakuntalā is following us and crying pitifully. Oh, what will my little girl do, now that her husband has cast her off so cruelly?

ŚĀRṅGARAVA (*turning sternly*). Wanton, you are too independent! (*Śakuntalā trembles with fear.*)

ŚĀRṅGARAVA. Śakuntalā!

If you are what the king says you are
you are cast off by your family, and your father is nothing to you;
but if you know your vow to be true
even bondage in your husband's home is good.

You must stay behind, and we must go!

THE KING. Hermit, why do you delude this lady?

The moon awakens the night-flowering lotuses,
and the sun those that flower by day.

The way of the man of self-control
is to have no dealings with the wife of another.

ŚĀRṅGARAVA. When Your Majesty has such a short memory for his past deeds he does well to be so fearful of sin!

THE KING (*to the Chief Priest*). * I ask you the rights and wrongs of the matter.

I wonder, am I forgetful,
or has she told me lies?
Shall I abandon my own wife
or sin by touching another's?

THE CHIEF PRIEST (*thoughtfully*). If you ask me, this is what I think should be done.

THE KING. Command me, Your Honour!

THE CHIEF PRIEST. Let the lady stay in my home until the child is born. If you ask why, this is my reason—Long ago the wise men told you that your first son would become a universal emperor. If the son of the hermit's daughter bears the tokens of such kingship you should congratulate her and take her into your harem—otherwise send her back to her father.

THE KING. It shall be as my master pleases.

THE CHIEF PRIEST. Child, follow me!

* This stage direction is inserted by us. All the others are Kālidāsa's. In their comparatively full stage directions Sanskrit plays contrast strikingly with those of ancient Greece.

ŚAKUNTALĀ. O holy Earth, open for me! (*She starts to go, and leaves with the Chief Priest. The hermits depart. The King, his memory clouded by the curse, thinks about Śakuntalā.*)³⁸

Soon the Chief Priest returns. As he was leading Śakuntalā to his home a heavenly shape appeared and carried her up to heaven. It was her mother, the nymph Menakā, who had come to take her to her true parents' home for her confinement.

Act six introduces two policemen and a fisherman. He has found a precious ring in the maw of a fish, and is hauled before the king under the suspicion of having stolen it. As soon as Duṣyanta sees the ring he recognizes it as the one he gave Śakuntalā, and his memory returns. But Śakuntalā has vanished. For a while the King gives himself up to grief, for he has lost his wife and he has no heir. Soon he assuages his sorrow in action, for Mātali, the charioteer of Indra, brings him word that his help is needed in the long war between gods and demons.

The final act takes place several years later on the lower slopes of heaven, at the hermitage of the divine sage Mārīca. Duṣyanta is returning victorious from battle, when he sees a small boy, nobly wrestling with a tame lion cub. He stops his chariot to admire the child's courage and strength, and is told that he is Bharata, the son of Śakuntalā. The lovers are reunited, and all ends happily.

In many respects "Śakuntalā" is comparable to the more idyllic comedies of Shakespeare, and Kaṇva's hermitage is surely not far from the Forest of Arden. The plot of the play, like many of Shakespeare's plots, depends much on happy chances and on the supernatural, which, of course, was quite acceptable to the audience for which Kālidāsa wrote. Its characters, even to the minor ones, are happily delineated individuals. In the passage we have quoted the two hermits, who play no further part in the action, are sharply differentiated. Śārṅgarava is a brave and upright man, fearless in his denunciation of wickedness in high places, but rather stern and hard in his righteousness. Śāradvata, on the other hand, betrays himself in two lines as a moral weakling, anxious to escape from an unpleasant situation as quickly as possible. Kālidāsa makes no pretence to realism, but his dialogue is fresh and vigorous. In fact the dialogue of the better Sanskrit plays generally seems based on vernacular, and is full of idiomatic expressions. Indian playgoers did not demand the conflict of feelings and emotions which is the chief substance of serious European drama, but Kālidāsa was quite capable of portraying such conflict effectively. His beauties and merits are tarnished by any translation, but few who can read him in the original would doubt that, both as poet and dramatist, he was one of the great men of the world.

c. 1st century A.D.

There were many other dramatists, of whom we can only mention a few. Śūdraka, probably Kālidāsa's approximate contemporary, has left only one play "The Little Clay Cart" (*Mṛcchakaṭika*). This is the most realistic of Indian dramas, unravelling a complicated story, rich in humour and pathos and crowded with action, of the love of a poor brāhmaṇ, Cārudatta, for the virtuous courtesan Vasantasenā; this story is interwoven with one of political intrigue, leading up to the overthrow of the wicked king Pālaka, and the play contains a vivid trial scene, after which the hero is saved from execution at the last moment. It is notable for its realistic depiction of city life, and for its host of minor characters, all of whom are drawn with skill and individuality. It has more than once been performed in translation on the European stage, and, to a Western audience, is certainly the most easily appreciated of Indian plays.

Viśākhadatta (?6th century) was the dramatist of politics. His only complete surviving play, "The Minister's Signet Ring" (*Mudrārāṣasa*), deals with the schemes of the wily Cāṇakya (p. 50) to foil the plots of Rāṣasa, the minister of the last of the Nandas, and to place Candragupta Maurya firmly on the throne. The plot is exceedingly complicated, but is worked out with great skill, and the play is beautifully constructed to lead up, like "The Little Clay Cart", to a pathetic scene where one of the chief characters is saved from death by impalement at the last moment. Another play by Viśākhadatta, "The Queen and Candra Gupta" (*Devicandragupta*), purporting to tell the story of the rise to power of Candra Gupta II (p. 65), exists only in fragments.

Three plays are ascribed to the great king Harṣa (p. 68f), though they may be the work of a "ghost writer". They are "Ratnāvalī", "Priyadarśikā", and "The Joy of the Serpents" (*Nāgānanda*). The first two, named after their heroines, are charming harem comedies, while the last is a play of religious purport, telling of prince Jimūtavāhana, who gives his own body to put a stop to the sacrifice of serpents to the divine Garuḍa (p. 300).

With Harṣa we may link his royal contemporary, the Pallava king Mahendravarman, who has left a one-act play "The Sport of the Drunkards" (*Mattavilāsa*). It treats of a drunken Śaivite ascetic, who loses the skull which he uses as a begging bowl, and accuses a Buddhist monk of stealing it. After much satirical dialogue, in which other dissolute ascetics of various persuasions and both sexes are involved, it is found that the skull has been stolen by a dog. This little farce, though slight, throws a flood of light on the life of the times and is full of Rabelaisian humour.

Second only to Kālidāsa in the esteem of the critics was Bhavabhūti,

who lived at Kānyakubja in the early 8th century. Three of his plays survive—"Mālatī and Mādhava", "The Deeds of the Great Hero" (*Mahāvīracarita*), and "The Later Deeds of Rāma" (*Uttararāmacarita*). The first is a love story with a pseudo-realistic background, full of incident of an exciting or horrific type, in which the heroine is more than once rescued from death, while the two latter plays tell the story of Rāma. By Western standards as a dramatist Bhavabhūti falls short of those we have mentioned earlier. His plots are weakly constructed and his characters lack individuality. His greatness rests on his deep understanding of sorrow; in his treatment of the pathetic and the terrible he perhaps excels Kālidāsa.

After Bhavabhūti the quality of Sanskrit drama declined. Playwrights of some merit, such as Bhaṭṭa Nārāyaṇa (? 8th century), Murāri (early 9th century), Rājaśekhara (9th-10th centuries), and Kṛṣṇamiśra (11th century), continued to write dramas, but their work grew more and more literary, and was evidently often rather intended for reading than for performance. We have records of the occasional production of Sanskrit plays until the Muslim invasion, after which the Sanskrit theatrical tradition, though not forgotten, became a thing of the past.

Sanskrit Prose Literature

The earliest surviving prose stories are a few narrative episodes in the Brāhmaṇas (p. 405f), followed by the Pāli Jātakas (p. 454f). In the Gupta period, however, there developed a style of ornate prose narrative, which was very different from the simple Pāli stories, and was classed as *kāvya*. The chief writers in this genre were Daṇḍin, Subandhu and Bāṇa, all of whom lived in the late 6th and early 7th centuries.

Daṇḍin's "Tales of the Ten Princes" (*Daśakumāracarita*) is a collection of exciting and ingenious stories, held together by a framing narrative and all interwoven with great skill. The prose is comparatively simple. Long compounds are numerous, but the inordinately lengthy sentences of Bāṇa are not to be found. The stories are secular, often humorous, and sometimes amoral, while the characters are well delineated. Some of the interest of the "Ten Princes" lies in its comparative realism, for in their adventures the ten heroes come in contact with merchants and thieves, princesses and prostitutes, peasants and wild hillmen. Few works of Indian literature tell us so much about low life.

As examples of Daṇḍin's style we give two little stories which are contained within the larger tales, and are intended to show contrasting aspects of the character of the fair sex. The styles are sharply

differentiated to fit the themes; the grisly story of Dhūminī is told in crisp short sentences with great economy of detail, while in the domestic idyll of Gomini Daṇḍin lingers lovingly on his words, and describes the charming scene in leisurely periods.

“There is a country called Trigarta, where there lived three householders, who had accumulated a great fortune. They were brothers, called Dhanaka, Dhānyaka and Dhanyaka. In those days Indra gave no rain for twelve years. The corn withered, plants were barren, trees bore no fruit, and the clouds were impotent; water courses dried up, ponds became mere mud-holes, and the springs ceased to flow. Bulbs, roots and fruit became scarce, folk-tales were forgotten, and all festive merrymaking ceased. Robber bands multiplied, and people ate one another's flesh. Human skulls, white as cranes, rolled on the ground. Flocks of thirsty crows flew hither and thither. Villages, cities, whole districts, were deserted.

“The three householders first ate their store of grain and then one by one their goats, their sheep, their buffaloes, their cows, their maidservants, their menservants, their children, and the wives of the eldest and the middle brother. Finally they decided that next day they would eat Dhūminī, the wife of the youngest; but the youngest brother, Dhanyaka, could not bring himself to eat his darling, so that night he stole away with her.

“When she grew weary he carried her, until they came to a forest . . . and they walked on through it until at last they came upon a man who was writhing on the ground, with his hands, feet, ears and nose cut off. He compassionately supported this man too on his shoulder, and for a long time the three dwelt in a hut which he painstakingly built of leaves in a corner of the forest which abounded in edible bulbs, roots and game. He healed the man's wounds with almond and sesamum oil, and fed him with a full share of his own meat and vegetables.

“One day when the man had quite recovered and was restored to health, when Dhanyaka had gone hunting, Dhūminī approached the man with desire for pleasure, and though he upbraided her she compelled him to satisfy her. When her husband came back and asked for water she said, ‘Draw it from the well yourself, I've got a splitting headache’, and tossed him the bucket and rope. As he was drawing water from the well she crept up suddenly behind him and pushed him in.

“Supporting the cripple on her shoulder she wandered from land to land, and gained the reputation of a devoted wife, and was much honoured. Finally she settled in Avanti, and lived in great affluence, thanks to the generosity of the king. One day she heard that her husband had been rescued from the well by a band of thirsty merchants, and was now roaming about the land of Avanti, begging his food. So Dhūminī declared to the unwitting king that he was the villain who had crippled her husband, and he condemned the good man to death by torture.

“As Dhanyaka was being led to execution, knowing that his appointed time had not yet come, he boldly said to the officer in charge, ‘If the beggar

I'm supposed to have crippled is ready to condemn me I deserve my punishment!' The officer thought that no harm could come of testing [his words, so he sent for the cripple]. As soon as the cripple was brought and saw Dhanyaka his eyes filled with tears. He fell at the good man's feet, and, being a man of noble mind, he told of Dhanyaka's kindness and the false Dhūmini's wickedness. The enraged king had the wicked woman's face disfigured, and made her serve as a cook in his kennels, while he bestowed great favour on Dhanyaka. And that is why I say that women are hard-hearted."

"In the land of the Dravidians is a city called Kāñcī. Therein dwelt the very wealthy son of a merchant, by name Śaktikumāra. When he was nearly eighteen he thought: 'There's no pleasure in living without a wife or with one of bad character. Now how can I find a really good one?' So, dubious of his chance of finding wedded bliss with a woman taken at the word of others, he became a fortune-teller, and roamed the land with a measure of unhusked rice tied in the skirts of his robe; and parents, taking him for an interpreter of birthmarks, showed their daughters to him. Whenever he saw a girl of his own class, whatever her birthmarks, he would say to her: 'My dear girl, can you cook me a good meal from this measure of rice?' And so, ridiculed and rejected, he wandered from house to house.

"One day in the land of the Śibis, in a city on the banks of the Kāverī, he examined a girl who was shown to him by her nurse. She wore little jewellery, for her parents had spent their fortune, and had nothing left but their dilapidated mansion. As soon as he set eyes on her he thought: 'This girl is shapely and smooth in all her members. Not one limb is too fat or too thin, too short or too long. Her fingers are pink; her hands are marked with auspicious lines—the barleycorn, the fish, the lotus and the vase; her ankles are shapely; her feet are plump and the veins are not prominent; her thighs curve smoothly; her knees can barely be seen, for they merge into her rounded thighs; her buttocks are dimpled and round as chariot wheels; her navel is small, flat and deep; her stomach is adorned with three lines; the nipples stand out from her large breasts, which cover her whole chest; her palms are marked with signs which promise corn, wealth and sons; her nails are smooth and polished like jewels; her fingers are straight and tapering and pink; her arms curve sweetly from the shoulder, and are smoothly jointed; her slender neck is curved like a conch-shell; her lips are rounded and of even red; her pretty chin does not recede; her cheeks are round, full and firm; her eyebrows do not join above her nose, and are curved, dark and even; her nose is like a half-blown sesamum flower; her wide eyes are large and gentle and flash with three colours, black, white and brown; her brow is fair as the new moon; her curls are lovely as a mine of sapphires; her long ears are adorned doubly, with earrings and charming lotuses, hanging limply; her abundant hair is not brown, even at the tips,* but long, smooth, glossy and fragrant. The character of such a girl cannot but correspond to

* Though a fair complexion was much prized in ancient India a trace of brownness in the hair, fairly common in the North, was thought very unbeautiful and inauspicious.

her appearance, and my heart is fixed upon her, so I'll test her and marry her. For one regret after another is sure to fall on the heads of people who don't take precautions!' So, looking at her affectionately, he said, 'Dear girl, can you cook a good meal for me with this measure of rice?'

"Then the girl glanced at her old servant, who took the measure of rice from his hand and seated him on the veranda, which had been well sprinkled and swept, giving him water to cool his feet. Meanwhile the girl bruised the fragrant rice, dried it a little at a time in the sun, turned it repeatedly, and beat it with a hollow cane on a firm flat spot, very gently, so as to separate the grain without crushing the husk. Then she said to the nurse, 'Mother, goldsmiths can make good use of these husks for polishing jewellery. Take them, and, with the coppers you get for them, buy some firewood, not too green and not too dry, a small cooking pot, and two earthen dishes.'*

"When this was done she put the grains of rice in a shallow wide-mouthed, round-bellied mortar, and took a long and heavy pestle of acacia-wood, its head shod with a plate of iron. . . . With skill and grace she exerted her arms, as the grains jumped up and down in the mortar. Repeatedly she stirred them and pressed them down with her fingers; then she shook the grains in a winnowing basket to remove the beard, rinsed them several times, worshipped the hearth, and placed them in water which had been five times brought to the boil. When the rice softened, bubbled and swelled, she drew the embers of the fire together, put a lid on the cooking pot, and strained off the gruel. Then she patted the rice with a ladle and scooped it out a little at a time; and when she found that it was thoroughly cooked she put the cooking pot on one side, mouth downward. Next she damped down those sticks which were not burnt through, and when the fire was quite out she sent them to the dealers to be sold as charcoal, saying, 'With the coppers that you get for them, buy as much as you can of green vegetables, ghee, curds, sesamum oil, myrobalans and tamarind.'

"When this was done she offered him a few savouries. Next she put the rice-gruel in a new dish immersed in damp sand, and cooled it with the soft breeze of a palm-leaf fan. She added a little salt, and flavoured it with the scent of the embers; she ground the myrobalans to a smooth powder, until they smelt like a lotus; and then, by the lips of the nurse, she invited him to take a bath. This he did, and when she too had bathed she gave him oil and myrobalans [as an unguent].

"After he had bathed he sat on a bench in the paved courtyard, which had been thoroughly sprinkled and swept. She stirred the gruel in the two dishes, which she set before him on a piece of pale green plantain leaf, cut from a tree in the courtyard. He drank it and felt rested and happy, relaxed in every limb. Next she gave him two ladlefuls of the boiled rice, served with a little ghee and condiments. She served the rest of the rice

* The economics of this and the other transaction referred to are very hard to explain. No doubt the rice husks, so carefully threshed, had some commercial value, but it is hardly likely that it would have bought the wares mentioned. If this passage has any historical significance it confirms the evidence of other sources that in ordinary times the means of subsistence were plentiful and cheap.

with curds, three spices [mace, cardamom and cinnamon], and fragrant and refreshing buttermilk and gruel. He enjoyed the meal to the last mouthful.

"When he asked for a drink she poured him water in a steady stream from the spout of a new pitcher—it was fragrant with incense, and smelt of fresh trumpet-flowers and the perfume of full-blown lotuses. He put the bowl to his lips, and his eyelashes sparkled with rosy drops as cool as snow; his ears delighted in the sound of the trickling water; his rough cheeks thrilled and tingled at its pleasant contact; his nostrils opened wide at its sweet fragrance; and his tongue delighted in its lovely flavour, as he drank the pure water in great gulps. Then, at his nod, the girl gave him a mouthwash in another bowl. The old woman took away the remains of his meal, and he slept awhile in his ragged cloak, on the pavement plastered with fresh cowdung.

"Wholly pleased with the girl, he married her with due rites, and took her home. Later he neglected her awhile and took a mistress, but the wife treated her as a dear friend. She served her husband indefatigably, as she would a god, and never neglected her household duties; and she won the loyalty of her servants by her great kindness. In the end her husband was so enslaved by her goodness that he put the whole household in her charge, made her sole mistress of his life and person, and enjoyed the three aims of life—virtue, wealth and love. So I maintain that virtuous wives make their lords happy and virtuous."³⁹

Subandhu, the next of the three great prose writers, is known only from one work, called after its heroine *Vāsavadattā*, which tells of the vicissitudes of her love for the prince Kandarpaketu. Unlike Daṇḍin, Subandhu was quite unable to tell a story, and had no sense of character. His merits lie in his ornate descriptions and his mastery of language, and his work consists of a series of descriptive tableaux, linked by a thin thread of narrative, each long description told in a single sentence which covers two or more pages of type. The work abounds in flowers of speech of all kinds—puns, *doubles entendres*, alliterations and assonances, and is a typical example of the *Gauḍa* (Bengālī) style of literary composition, as distinguished from the simpler *Vaidarbha* (Berār) style, with shorter, less involved sentences, employed by Kālidāsa and Daṇḍin. It cannot be enjoyed in translation and its merits are only apparent in the framework of its own standards. Of European literature perhaps Lily's *Euphues* and similar late Renaissance prose works most closely approach it in style and spirit.

Bāṇa's style is similar to that of Subandhu, but his work is much more vital and congenial to Western taste. Not only do his elaborate descriptions show accurate and close observation, but throughout his two works, the "Deeds of Harṣa" (*Harṣacarita*) and *Kādambarī*, the personality of the author breaks through. In the former

work, moreover, he gives us a fragment of autobiography unparalleled in Sanskrit literature. Bāṇa was born of a well-to-do brāhman family, and his mother died in his early childhood. At the age of fourteen he lost his father also, and, after a period of mourning, he began to sow his wild oats. He names with evident affection the bosom friends of his dissolute youth, which was spent in wandering from city to city among the intellectual bohemians of the time. His circle was remarkably wide, including ascetics of various sects, both orthodox and otherwise, literary men, actors, musicians, entertainers, doctors, and even humble people of low caste. The list of Bāṇa's friends, mentioned in no special order, is in itself sufficient to show how lightly the rules of caste weighed on the educated man. The author gives us no details of his adventures, but it would seem that in the course of them he was received at the court of Harṣa, whom he offended in some way. Later he returned for a while to his home, and resumed the peaceful life of a country brāhman; but soon a message came from Harṣa, demanding his attendance at court. He was at first received coldly, but afterwards was restored to favour.

Though religiously minded, Bāṇa seems throughout his life to have transcended the bounds of orthodoxy and to have retained some of the unconventionality of his wild youth. He was not afraid to put forward opinions which might have made him unpopular with his royal patron—for instance he condemned the doctrine of royal divinity as gross sycophancy, and attacked the Macchiavellian system of statecraft associated with the name of Kauṭilya as immoral and inhuman. Here and there in his work occur passages which show implicit sympathy with the poor and humble—a sentiment rarely found in ancient Indian literature—and he is a master of exact observation. For all the floweriness of his style Bāṇa's outlook has more in common with that of the 20th century than that of any other early Indian writer.

Of his two works the "Deeds of Harṣa" tells of the events leading up to Harṣa's rise to power with general authenticity, but with some evident exaggeration, and with a lack of circumstantial detail which the historian finds irritating. The work was apparently unfinished, since when it concludes the hero's destiny is still somewhat in doubt. *Kādambarī* is perhaps a conscious and successful attempt to improve on Subandhu's *Vāsavadattā*. The story is a romance, told in a series of narrated episodes which link together to build up a complicated plot. This work also was unfinished, and was completed by the author's son, whose prentice hand is quite evident.

As an example of Bāṇa's style we give a somewhat abridged and adapted version of his description of Harṣa's army striking camp to march against his enemies. In the original the whole consists of a

single sentence, the basis of which is the phrase "the royal court was filled with chieftains" near the end of the passage. The separate sentences or clauses of our translation are single compound words in the original.

"Then it was time to go. The drums rattled, the kettledrums beat joyfully, the trumpets blared, the horns blew, the conches sounded. By degrees the hubbub of the camp grew louder. Officers busily roused the King's courtiers. The sky shook with the din of fast-hammering mallets and drumsticks. The generals assembled the ranks of the subordinate officers. The darkness of the night was broken by the glare of a thousand torches which the people lighted. Lovers were aroused by the tramping feet of the women who kept watch. The harsh shouts of the elephant-marshals dispelled the slumber of their drowsy riders as awakened elephants left their stables.

"Squadrons of horses woke from sleep and shook their manes. The camp resounded loudly as spades dug up the tent-pegs, and the tethering chains of elephants clinked as their stakes were pulled up. . . . As the foragers released the elephants all space was filled with the clanking of their fetters. Leather bags full to bursting were placed on their dusty backs, which had been rubbed down with tufts of hay. Servants rolled up the canvasses and awnings of tents and pavilions, and the bundles of tent-pegs were stored away in bulging leather sacks. Store-keepers assembled their stores, and many elephant-drivers loaded them. The dwellings of the vassals were cluttered with cups and cooking utensils, which were lifted on to the backs of elephants, steadied by their riders. The soldiers laughed as the fat strumpets were dragged away by force, resisting vigorously with feet and hands. The many mighty and savage elephants trumpeted, as the girthbands of their bright harness were tightened, and restricted the freedom of their limbs. . . . Camels neighed in annoyance as sacks were loaded on their backs.

"The wives of highborn gentlemen were visited in their carriages by go-betweens sent by princes. Elephant-captains, who had forgotten that it was time to go, looked for their servants. The splendid horses of the King's favourites were led by footmen wealthy with their masters' gifts. Troops of handsome warriors adorned their bodies with circles of unguent, scented with camphor. The harness of the marshals' horses was hung with bags of salted peas, little bells, and whistles.* Monkeys sat among the troops of horses, as the grooms straightened their tangled reins. Stablemen dragged sacks of musty fodder for the horses' morning meal. The calls of the grass-cutters grew louder and louder. There was uproar in the stables as young horses strained and reared and swerved at the confusion of starting. Girls hurried at the call of the riders of the harnessed horses with unguents for their faces. As the elephants and horses set out the poor folk of the

* Cowell and Thomas (The Harṣacarita of Bāṇa, p. 200) take *lavaṇakalāyī* as "wooden figures of deer" on the basis of a late commentary. *Lavaṇa* means salt, and *kalāya* a type of pea, and we believe the compound to mean a bag of salted peas, the horse's iron rations. The translation of *kinkīṇī-nālī-sanātha* as "bells with reeds attached" is equally improbable. The horse's harness would be hung with bells, but *nālī*, "reed" or "tube", may well mean a whistle attached to the harness by a cord, and used for signalling.

neighbourhood ran up to loot the remains of the heaped grain. Donkeys plodded on together, loaded with piles of clothing. The trampled roads were filled with carts with creaking wheels. Oxen were loaded with equipment which would suddenly fall off. The strong oxen, first to be driven away, lagged behind, drawn by the grass which grew by the roadside.

"In front went the field-kitchens of the chief vassals. Standard bearers led the ranks. As the troops left their small huts hundreds of their friends came out to meet them. The feet of the elephants trampled the hovels by the roadside, and the people came out and threw clods at their keepers, who called on the bystanders to witness their assaults. Poor families ran from their wrecked and ruined huts. Oxen, bearing the wealth of unfortunate merchants, fled from the hubbub. Clearing a path through the crowd with the glare of their torches, runners led the way for the elephants bearing the women of the harem. Horsemen shouted to the dogs running behind them. The veterans praised the tall Taṅgaṇa horses, which trotted so smoothly and quickly that they made travelling a pleasure. Unhappy Southerners upbraided their fallen mules. The whole world was swallowed in dust.

"The royal court was filled with chieftains who had come from every quarter, riding on cow-elephants, whose drivers bore bows adorned with stripes of gold-leaf. Seated within [the howdahs] their batmen carried their swords. Their betel-bearers fanned them with flywhisks. The soldiers seated in the rear bore bundles of javelins in cases. The trappings [of the elephants] bristled with curved sabres and gilded arrows. . . . The thighs [of the chieftains] were clothed in fine-patterned silk, but their legs were covered with mud-stained trousers. . . . Their tunics were decked with dark jewels, which glistened against their bodies. They wore Chinese cuirasses, doublets adorned with bright clusters of pearls. . . . and scarves as bright as a parrot's wing. All the ends of the earth were filled with knights and warriors, who hurried on with tossing shields and plumes. The ends of heaven were loud with the jingling golden ornaments on the harness of the prancing Kamboja steeds in their hundreds. The ear was deafened by the harsh booming of hundreds of large kettledrums, mercilessly beaten. The roll was called. With upturned faces the footmen awaited the order to march."⁴⁰

After Bāṇa similar prose romances were often written, as well as stories in mixed prose and verse (*campū*), but none is of much literary importance, and most are derivative, pedantic and dull.

Another branch of prose narrative literature was the fable, which we meet first in the Pāli Jātakas. These cheerful little stories, whose actors are often talking animals, have much in common with the fables popular in ancient Greece, and there has been some discussion on the question of influence. Direct borrowing is unlikely, though it may be that some of the tales were derived from a common source in the ancient Middle East. Whatever the origin of these stories Indian folklore did influence the literature of the West, for one of the most

famous Indian collections of fables, the *Pañcatantra*, was translated into Pahlavī, or Middle Persian, in the 6th century. Thence it was translated into Syriac, and thence again, in the 8th century, into Arabic. In various versions it appeared in Hebrew, Greek and Latin, and found its way all over Europe. The earliest English version is that of Sir Thomas North, called "The Morall Philosophie of Doni" after the name of the translator of the Italian version, which North used. This appeared in 1570, and was the earliest work of Indian literature (much garbled by successive translations) to be published in English. The fables of La Fontaine are admittedly based on "Pilpay", the form in which Vidyāpati, the title of the Indian sage who is said to have narrated the stories, reached Europe. As well as the fables of La Fontaine the stories of Reynard the Fox, popular in the folk literature of many parts of Europe and given finished form by Goethe, owe much to this source. Other Indian tales, including several from the *Bṛhatkathā* (p. 429), found their way westwards, and the "Arabian Nights" owes several of its stories and themes to India, including some of the marvels met by Sindbad the Sailor.

The *Pañcatantra* ("Five Treatises") is in theory a book of instruction in *nīti*, or the conduct of one's affairs, especially intended for kings and statesmen. The little stories are contained in a framing narrative which tells how a king was distressed at the evil and stupidity of his sons, and entrusted them to a sage who reformed them in six months by telling them a series of fables. The book exists in several versions of varying length and merit, mostly in prose, but with many verses of a gnomic type. The most famous of these versions is Nārāyaṇa's *Hitopadeśa* ("Salutary Instruction"), composed in Bengal in the 12th century. The work was intended as a "reader" for students of Sanskrit, and serves that purpose well down to the present day. Never was a school textbook better written. The author was compelled by his purpose to avoid the euphuisms and pedantries which affected most of the literature of his time, and he wrote lucidly and wittily, liberally including memorably terse gnomic stanzas. Ethically many of the stories are dubious, for they encourage caution and self-interest rather than altruism. The two stories we quote are boxed within others.

"It is said:

He who takes a well-spoken knave
to be a man of his own stamp
is fooled by rogues, like the brāhman
who was robbed of his goat.'

"How did that happen?' asked the King.

“‘In the forest of Gautama,’ said Meghavarṇa, ‘there lived a brāhmaṇ famous for his sacrifices. Once he went to a village and bought a goat for sacrifice, and as he was carrying it home on his shoulder he was seen by three rogues. “If we could find a way to get that goat,” they said to themselves, “it would be a fine trick!” So they stationed themselves each under a tree about a *krośa* apart. As the brāhmaṇ passed by, the first rogue said, “Why, brāhmaṇ, that’s a dog you’re carrying on your back!” “It’s not a dog,” replied the brāhmaṇ, “it’s a goat for sacrifice!”

“‘Then the next rogue addressed him with the same words. This time the brāhmaṇ put the goat on the ground and looked at it hard, and again slung it over his shoulder and went on, his mind wavering like a swing; for

The words of rogues make even the mind of a good man waver.
If he trusts them he dies like Pretty-ears.’

“‘How did that happen?’ asked the King.

“‘In a forest land,’ he said, ‘there lived a lion named Madotkaṭa, who had three servants, a crow, a tiger and a jackal. Once as the three were out walking they met a camel, and they asked him whence he came, and whether he had fallen out of a caravan. He told them his story, and they took him back and handed him over to the lion, who gave him his freedom and security; and he took the name of Pretty-ears.

“‘Later the lion was taken ill, and there was heavy rain and they were very distressed for want of food. So they agreed so to arrange matters that their lord should kill Pretty-ears. “Of what other use,” they said to themselves, “is that eater of thorns to us?” “But how can we manage it,” said the tiger, “when our master has given him a pledge of security and has him in his favour?” “At a time like this,” said the crow, “when the master is reduced to skin and bone, he won’t scruple at a sin; for

A woman torn by hunger will abandon her child.
A snake torn by hunger will eat its own eggs.
What evil will a hungry man not do?
Lean men are always pitiless!

And, what is more,

A drunkard, an imbecile, a lunatic,
a man tired out, an angry man, a hungry man,
a greedy man, a frightened man, a hasty man,
or a man in love never do the right thing.”

“‘After thus deliberating they all went to the lion. “Have you found anything to eat?” the lion asked. “We’ve done our best,” they replied, “but we haven’t found a thing!” “Well,” said the lion, “how are we to keep alive now?” “Sire,” said the crow, “if we don’t get our natural food we’ll all surely die.” “And what,” asked the lion, “is our natural food?” “Pretty-ears!” whispered the crow in the lion’s ear.

“‘The lion touched the earth and covered his ears in horror. “We’ve given him a pledge of security,” he said, “and we must stand by it. How can we eat him? For

Not gifts of land nor gifts of gold,
nor gifts of cattle nor gifts of food
are said to be the greatest gift.
Of all gifts greatest is the gift of safety.

Moreover

The merit of the horse-sacrifice,
the fulfilment of all desires,
comes to the man who protects
those who take refuge with him.”

““‘True!” said the crow. “Our lord must not kill him. But there’s no reason why we shouldn’t so arrange things that he offers his body voluntarily.” At this the lion kept silence. So when a suitable occasion offered the crow found a pretext to bring them all into the lion’s presence. “Sire,” he said, “however hard we try we can find no food. Your Majesty is weak from days of fasting. So now make a meal of my flesh, for

All subjects are dependent on their lord.
Only well-rooted trees bear fruit,
and only when the king is strong
do men’s works prosper.”

““‘I’d rather die myself than do such a thing!” said the lion.

““Then the jackal made the same offer. “Never!” the lion replied.

““The tiger next spoke up. “Let my lord live on my own body!” he said. “Such a thing can never be right!” the lion replied.

““Finally Pretty-ears, full of confidence, offered himself in the same way. And, in accordance with his offer, the lion ripped his belly open and they all ate him up.

““And that is why I say:

The words of rogues make even the mind of a good man waver.
If he trusts them he dies like Pretty-ears.

““Meanwhile the brāhmaṇ met the third rogue, who spoke to him in the same way. This time he decided that his senses were defective. So he abandoned the goat, took a ritual ablution, and went home, while the rogues took the goat away and ate it. And so I say:

He who takes a well-spoken knave
to be a man of his own stamp
is fooled by rogues like the brāhmaṇ
who was robbed of his goat.”⁴¹

Pāli Literature

The Pāli language was closer to the speech of the ordinary man than was Sanskrit, and its style was in general simpler; but though they contain many fine passages the Pāli scriptures are largely prosaic and repetitive. The same stock phrases and descriptions, often quite lengthy, occur again and again with a dull monotony which can only be circumvented by drastic abridgement. Yet the narrative portions of the Pāli canon are frequently of much merit. Here for instance, somewhat abridged, is the canonical account of the Buddha's "Great Retirement", a passage of intense dramatic force.

"Then lovely women, decked like the damsels of the gods with every kind of ornament and well trained in dance and song, began to perform. But the Bodhisattva had no taste for dancing, and for a while sleep overcame him. The women thought: 'He for whose sake we danced and sang has fallen asleep—why should we trouble ourselves further?' And they put up their instruments and lay down. The lamps of scented oil burned on.

"The Bodhisattva awoke and sat cross-legged on his couch. He saw the women with their instruments laid aside, fast asleep. Saliva trickled from the mouths of some; some were covered in sweat; some ground their teeth in sleep; some snored; the garments of some were in disarray, so that they repulsively showed their private parts. When he saw them thus in their dishevelment he was more than ever disgusted with the life of passion. The great hall, decked like the heavenly palace of Indra, seemed to him like a charnel ground full of scattered corpses. Life seemed as fleeting as a house on fire. 'How wretched it all is! How afflicted it all is!!' he cried, and his mind was set even more strongly on asceticism. 'Today I must go forth on the Great Retirement,' he thought, and he rose from his bed and went to the door.

"There lay Channa, his head on the threshold. 'Today I must go forth on the Great Retirement,' he said, 'get ready my horse'. . . . When he had thus sent Channa he thought 'I will see my son', and he went to the apartments of the Mother of Rāhula, and opened the bedroom door. A little lamp of scented oil burned in the inner room. The Mother of Rāhula was sleeping on a bed thickly strewn with flowers, with her son's head on her arm. The Bodhisattva set one foot on the threshold and stood gazing at them. 'If I move her hand and take up my son I shall waken the queen,' he thought, 'and then I shall not be able to go. When I am a Buddha I will come back and see my son.' And he left the palace."⁴²

As a further example of Pāli prose we give a Jātaka tale. This story, inculcating the fickleness of women, has of course no religious value, and its origin is certainly secular, but we give its framework, in order that the reader may see how the most unpromising material has been pressed into service for religious purposes. This story is typical of the terse dry style of the collection, and of the tales of

marvels which were very popular in India then as now. The reader will recall that the verses are the original, round which the story itself is built as a sort of commentary.

"The Master, who was living at Jeta's Grove at the time, told this story in connexion with a backsliding brother. The Master asked him if he wanted to return to the world and regretted taking orders. 'It's all because of the wiles of women,' the monk answered. 'Brother,' said the Master, 'it's impossible to keep on your guard against women! Wise men of old couldn't guard against them, even when they dwelt in the realms of the *suparṇas*.*' And when the brother pressed him the Master told an old story.

"In former times King Tamba ruled the kingdom of Banāras. He had a chief queen named Sussonḍī, a woman of the utmost beauty. The Bodhisattva was born then as a *suparṇa*. At that time there was an island of serpents called the Island of Seruma. In that island the Bodhisattva dwelt in a palace of *suparṇas*.

"One day he went to Banāras in human guise, and gambled with King Tamba. The attendants saw how fair he was, and told Sussonḍī that a handsome man was gambling with the King. She wanted to see him, so one day she put on all her ornaments and came to the gambling-hall, where, standing among her maids, she watched him. And then he saw the Queen. The two fell in love with one another. The King of the *Suparṇas* stirred up a magic wind in the city, and everyone rushed from the royal palace, fearing that it might fall. With his magic power he created darkness, seized the Queen, and flew to his palace in the Isle of Serpents.

"Nobody knew where Sussonḍī had gone, but the *Suparṇa* took his pleasure of her and went back to play with the King. Now the King had a minstrel named Sagga. Not knowing what had happened to the Queen he said to the minstrel, "Go and seek over land and sea, and find out where the Queen has gone." So he took money for his journey and, starting with the suburbs, he sought everywhere until he came to Bhṛgukaccha. Just then some merchants of Bhṛgukaccha were setting out by ship for the Land of Gold (Burma). He went up to them and said, "I'm a minstrel. If you'll remit my fare and take me with you I'll make music for you." They agreed, took him aboard, and set sail.

"When the ship was well under way they called him to make music for them. "I'd willingly make music for you," he said, "but if I did the fish would leap out of the water and smash your ship". "When a mere man makes music the fish don't get excited," they said, "so tune up!" "Then don't blame me for anything that may happen," he said, and he tuned his lute and made music, with strings and voice in perfect unison. The fish heard the sound, and leapt with excitement. Then a sea-monster (*makara*) leapt from the sea, fell on the ship, and smashed it to pieces. Sagga lay on a plank and drifted with the wind to the Isle of Serpents, and landed by a banyan tree near the palace of the King of the *Suparṇas*.

"Now the King of the *Suparṇas* had gone away to play dice, and so

* A class of large mythical bird, of whom Garuḍa (p. 300) is the chief.

Queen Sussondī had come down from the palace and was walking on the shore; and she saw and recognized Sagga the minstrel, and asked him how he came. He told her all his story. She told him not to be afraid, and comforted him, and clasped him in her arms, and had him taken to the palace, where she laid him on a couch. When he was revived she gave him fine food, bathed him in sweetly scented water, dressed him in fine clothes, adorned him with beautiful fragrant flowers, and again made him rest on the fine couch. So she cared for him, and whenever the King of the Suparṇas returned she hid him; then, as soon as he went again, she took passionate pleasure with him.

““When a month and half a month had passed, merchants from Banāras landed on that island at the foot of the banyan tree in search of fuel and water. He boarded their ship, went back to Banāras, and saw the King while he was gambling. Then he took his lute, and, making music, sang the first stanza:

“There blows the scent of timīra trees
with the sounding of the evil sea,
but Sussondī is far away.
Tamba, desires torment me!”

““When he heard this, the Suparṇa sang the second stanza:

“How did you cross the ocean?
How came you to see Seruma?
How was it, Sagga,
that she and you did meet?”

““Then Sagga sang three stanzas:

“From Bhṛgukaccha there sailed
traders in search of wealth.
A monster broke their ship.
I floated on a plank.

“In her soft and tender lap
ever fragrant with sandal
the gentle lady pillowed me,
as a mother her own son.

“This you should know, King Tamba,
the fair-eyed lady gave me
food with her own hands,
and drink, and raiment, and a bed.”

““Even as the minstrel sang the Suparṇa was filled with regret. “Though I dwelt in the Palace of the Suparṇas,” he thought, “I could not keep her! What is the wanton to me?” So he brought her back, gave her to the King, and went away. And he never came again.”

“When the story was over the Master declared the Four Noble Truths (p. 269), and identified the births. . . . ‘Ānanda (p. 261) was the King of Banāras, and I was the King of the Suparṇas.’”⁴³

As examples of Pāli poetry we give a few verses from the "Songs of the Elder Monks and Nuns" (*Theragāthā* and *Therīgāthā*), a collection of poems ascribed, falsely no doubt, to the great disciples of the Buddha in the early days of the Order. The style of these poems is simpler than that of courtly Sanskrit literature, and suggests the influence of popular song. The first is attributed to Ambapālī, the beautiful courtesan of Vaiśālī who became a Buddhist nun.

"Black and glossy as a bee and curled was my hair;
now in old age it is just like hemp or bark-cloth.
Not otherwise is the word of the truthful. . . .

"My hair clustered with flowers was like a box of sweet perfume;
now in old age it stinks like a rabbit's pelt.
Not otherwise is the word of the truthful . . .

"Once my eyebrows were lovely, as though drawn by an artist;
now in old age they are overhung with wrinkles.
Not otherwise is the word of the truthful. . . .

"Dark and long-lidded, my eyes were bright and flashing as jewels;
now in old age they are dulled and dim.
Not otherwise is the word of the truthful. . . .

"My voice was as sweet as the cuckoo's, who flies in the woodland thickets;
now in old age it is broken and stammering.
Not otherwise is the word of the truthful. . . .

"Once my hands were smooth and soft, and bright with jewels and gold;
now in old age they twist like roots.
Not otherwise is the word of the truthful. . . .

"Once my body was lovely as polished gold;
now in old age it is covered all over with tiny wrinkles.
Not otherwise is the word of the truthful. . . .

"Once my two feet were soft, as though filled with down;
now in old age they are cracked and wizened.
Not otherwise is the word of the truthful. . . .

"Such was my body once. Now it is weary and tottering,
the home of many ills, an old house with flaking plaster.
Not otherwise is the word of the truthful."⁴⁴

Few ancient Indian poems show such a deep love of nature as some of these verses, ascribed to pious monks of the 5th century B.C.

COINS OF BACTRIA AND NORTH-WEST INDIA

a

Fighting Elephant

b

Iranian Goddess.

GRICO-BACTRIAN SILVER DISCS. 3RD-2ND CENTURY B.C.

“When the drum of the clouds thunders in heaven,
and all the ways of the birds are thick with rain,
the monk sits in the hills in ecstasy
and finds no joy greater than this.

“When by rivers covered with flowers,
and gaily adorned with reeds of varied hue,
the goodly monk sits on the bank in ecstasy
he finds no joy greater than this.

“When the rain pours down at night,
and elephants trumpet in the distant thickets,
the monk sits in the hills in ecstasy,
and finds no joy greater than this.”⁴⁵

“When the crane with clear pale wing
flies in fear from the black cloud,
seeking shelter and finding none,
The river Ajakaraṇī gives me joy.

“Who would not love
the rose-apple trees
fair on either bank
beside the great cavern?

“Freed from the fear of flocks of cranes
the frogs croak softly now.
This is no time to leave the hills and streams !
Safe, good and pleasant is Ajakaraṇī”.⁴⁶

As an example of Pāli descriptive poetry we give a stirring passage from the Ceylon Chronicle, the *Mahāvamsa*, describing the capture of Vijitanagara, the capital of the Tamil invader Eḷāra, by the Sinhalese national hero, King Duṭṭhagāmaṇī (161–137 B.C.), with the aid of his favourite elephant, Kaṇḍula.

“The city had three moats,
and was guarded by a high wall.
Its gate was covered with iron
hard for foes to shatter.

“The elephant knelt on his knees
and, battering with his tusks
stone and mortar and brick,
he attacked the iron gate.

“The Tamils from the watch-tower
threw missiles of every kind,
balls of red-hot iron
and [vessels of] molten pitch.

“Down fell the smoking pitch
upon Kaṇḍula’s back.
In anguish of pain he fled
and plunged in a pool of water.

“‘This is no drinking bout!’
cried Goṭhāimbara.
Go, batter the iron gate!
Batter down the gate!!’

“In his pride the best of tuskers
took heart and trumpeted loud.
He reared up out of the water
and stood on the bank defiant.

“The elephant-doctor washed away
the pitch, and put on balm.
The King mounted the elephant
and rubbed his brow with his hand.

“‘Dear Kaṇḍula, I’ll make you
the lord of all Ceylon!’
he said, and the beast was cheered,
and was fed with the best of fodder.

“He was covered with a cloth,
and he was armoured well
with armour for his back
of seven-fold buffalo hide.

“On the armour was placed
a skin soaked in oil.
Then, trumpeting like thunder,
he came on, fearless of danger.

“He pierced the door with his tusks.
With his feet he trampled the threshold.
And the gate and the lintel
crashed loudly to the earth.” 47

Prākṛit Literature

Space will not permit more than a brief reference to the Prākṛit scriptures of the Jainas, examples of which we have already quoted (p. 293f). In general they have little literary value. Like Jainism itself they tend to be arid, and, like the Pāli scriptures but in even greater measure, they repeat lengthy stock phrases and descriptions, which may have had some mnemonic value, but which to the modern reader are very irritating. Lengthy descriptions of the Tīrthaṅkaras, of pious monks, mighty kings, wealthy merchants, prosperous cities etc. occur over and over again, in exactly the same words throughout the canon, and give it a flavour of uninspired dryness. The style is somewhat more ornate than that of the Pāli scriptures, and closer to courtly Sanskrit.

The poetry of the Jainas is better than their prose. In this connexion we cannot refrain from quoting a remarkable poem, which is one of the most humorous things in ancient Indian literature, and which, by some lucky chance, has found its way into the Jaina canon, among the austere pages of the *Sūtrakṛtāṅga*. It is intended as a warning of the grim fate in store for the backsliding monk, and throws a most unexpected light on one aspect of Indian marriage. Our translation is rather free, but we have tried to keep some of the lively vernacular style of the original.

“A celibate monk shouldn’t fall in love,
and though he hankers after pleasure he should hold himself in check,
for these are the pleasures
which some monks enjoy.

“If a monk breaks his vows,
and falls for a woman,
she upbraids him and raises her foot to him,
and kicks him on the head.

“‘Monk, if you won’t live with me
as husband and wife,
I’ll pull out my hair and become a nun,
for you shall not live without me!’

“But when she has him in her clutches
it’s all housework and errands!
‘Fetch a knife to cut this gourd!’
‘Get me some fresh fruit!’

“‘We want wood to boil the greens,
and for a fire in the evening!’
‘Now paint my feet!’
‘Come and massage my back!’ . . .

“‘Get me my lip-salve!’
 ‘Find my sunshade and slippers!’
 ‘I want a knife to cut this string!’
 ‘Take my robe and have it dyed blue!’ . . .

“‘Fetch me my tweezers and my comb!’
 ‘Get me a ribbon to tie my hair!’
 ‘Now pass me my looking-glass!’
 Put my toothbrush down beside me!’ . . .

“‘Fetch the pot and the drum and the rag-ball,
 for our little boy to play with!’
 ‘Monk, the rains are on the way,
 patch the roof of the house and look to the stores!’

“‘Bring me the chair with the twine seat,
 and my wooden-soled slippers to go out walking!’
 So pregnant women boss their husbands,
 just as though they were household slaves.

“‘When a child is born, the reward of their labours,
 she makes the father hold the baby.
 And sometimes the fathers of sons
 stagger under their burdens like camels.

“‘They get up at night, as though they were nurses,
 to lull the howling child to sleep,
 and, though they are shamefaced about it,
 scrub dirty garments, just like washermen. . . .

“‘So, monks, resist the wiles of women,
 avoid their friendship and company.
 The little pleasure you get from them
 will only lead you into trouble!’”⁴⁸

A number of medieval works of a secular nature were written in Prākṛit, chief of which are the poems “The Building of the Causeway” (*Setubandha*), describing Rāma’s invasion of Ceylon and falsely ascribed to Kālidāsa; “The Slaying of the King of Bengal” (*Gauḍa-radha*), a long panegyric by the 8th-century poet Vākpati, describing the exploits of Yaśovarman, king of Kānyakubja (p. 70); and a drama named after its heroine, Karpūramañjarī, by the 10th-century dramatist Rājaśekhara. These works, though not without merit, are indistinguishable in style and content from comparable Sanskrit productions, and need not detain us.

The most important literary work in Prākṛit is the "Seven Hundred" (*Saptasataka*) of Hāla. This is a large collection of self-contained stanzas of great charm and beauty, in the *Āryā* metre (p. 511f). Their traditional author was the shadowy Sātavāhana king Hāla, who ruled in the Deccan in the 1st century A.D., but in fact many of these verses seem considerably later, and they must be looked on as anonymous. They are notable for their conciseness; like Amaru, their authors were able to suggest a whole story in four short lines. This great economy of words and masterly use of suggestion would indicate that the verses were written for a highly educated literary audience; but they contain simple and natural descriptions and references to the lives of peasants and the lower classes, which point to popular influence. The treatment of the love affairs of country folk reminds us of early Tamil poetry, and suggests that "Hāla" may have tapped a widely diffused source in South Indian folksong.

"Last night with scorn the lady gave the wanderer
straw for his bed.
This morning she gathers it together,
weeping."

"This morning, my friend, I heard a man singing,
and his song reminded me of my lover,
and opened all the wounds
that the shafts of the Love-god had made in my heart."

"Waiting for you, the first half of the night
passed like a moment.
The rest was like a year,
for I was sunk in grief."

"When the season of rains, with its high clouds,*
has passed like youth,
the earliest single *kāsa* flower
comes, like a grey hair on the earth."

"Ungrateful lover, still I see the mud
in the village street,
which, on a rainy night,
I trod for your sake, shameless one!" 49

⚡ Tamil Literature

The oldest Tamil literature goes back to the early centuries of the Christian era. Its dating is still a matter of some dispute but it

* There is a pun here on *paohare*, which may mean either "clouds" or "breasts".

seems almost certain that the earliest stratum was composed before the great Pallava dynasty of Kāñcī became dominant in the Tamil Land in the 6th century, and it is probably some centuries older than this.

Tamil tradition tells of three literary academies (*śaṅgam*) which met at Madurai. The earliest of these was attended by gods and legendary sages, and all its works have perished. Of the second, there survives only the early Tamil grammar, *Tolkāppiyam*. The poets of the Third Śaṅgam, on the other hand, wrote the "Eight Anthologies" (*Ettutogai*), which are the greatest monument of ancient Tamil literature, as well as a number of later works. Some authorities have doubted the tradition of the Śaṅgams, and it is almost certain that the grammar *Tolkāppiyam*, attributed to the Second Śaṅgam, is later than many of the poems of the Third. But the tradition of the Śaṅgams, which is a strongly held one, has no parallel in Northern legend, and we may believe that the bards of the Tamil Land, who wandered over the country enjoying the patronage of chieftains and villagers alike, would meet from time to time in the city of Madurai for great festivals of poetry and music, and that many of the verses of the Anthologies were recited there.

The poetry of the "Eight Anthologies" is little known outside the land of its origin, and its language is so archaic that the modern educated Tamil cannot read it without special study. The relation of the language of the Śaṅgam literature to Tamil as it is now written is perhaps similar to that of *Piers Plowman* to modern English. The tradition of Tamil poetry at the time of the composition of these works must already have been a long one, for the poetic conventions finally fixed in the *Tolkāppiyam* had almost reached their finished form even in the earliest poems of the Anthologies. But their style is much nearer that of folk literature than is that of courtly Sanskrit verse. The life of the peasant and the scenes of the countryside, the bustle of the towns and the ruthlessness of war, are here depicted as though from direct experience, and with no formal unrealistic idealization.

Together the "Eight Anthologies"* make up a very large body of poetic literature, and contain well over 2,000 poems, ascribed to more than 200 authors. To them must be added "The Ten Songs" (*Patuppāṭṭu*), containing ten longer poems of similar style but somewhat later date. Until the end of the last century this great collection was

* *Narīṇai*: 400 short poems on love, each of from nine to twelve lines; *Kuruntogai*, 400 love poems of from four to eight lines each; *Aingurunūru*, 500 short erotic poems; *Padīrūppaṭṭu*, a short collection of eight (originally ten) poems, each of ten verses, in praise of the king of the Cēra country (Malabār); *Paripādal*, twenty-four (originally seventy) poems in praise of gods; *Kalittogai*, 150 love poems; *Aganānūru*, 400 love-lyrics of varying length; and *Puraṇānūru*, 400 poems in praise of kings.

almost forgotten, even by the Tamils themselves; only within the last fifty years have the rare manuscripts containing it been edited and given to the world. Much is still untranslated, and the full and thorough study of the Śaṅgam literature from the critical and historical point of view has yet to be made.

Very early the Tamils developed the passion for classification which is noticeable in many aspects of ancient Indian learning. Poetry was divided into two main groups: "internal" (*agam*), dealing with love, and "external" (*puṛam*), dealing with the praise of kings. A further division was made according to the region of the Tamil Land to which the poem referred or was most appropriate. Conventionally there were five regions (*tiṇai*): the hills (*kuriṇṇi*), the dry lands (*pālai*), the jungle and woodland (*mullai*), the cultivated plains (*marudam*), and the coast (*neydal*). Each was connected with some special aspect of love or war; thus the hills were the scene of poems on pre-nuptial love and cattle-raiding; the dry lands, of the long separation of lovers, and of the laying waste of the countryside; the jungle, of the brief parting of lovers, and of raiding expeditions; the valleys, of post-nuptial love or the wiles of courtezans, and of siege; and the seacoast, of the parting of fishermen's wives from their lords, and of pitched battle. To each region were attributed its own appropriate flowers, animals and people. Every poem of the "Eight Anthologies" was classified in one of the five sections, but much of the poetry was written with little regard for this formal classification.

A unique feature of Tamil poetry is the initial rhyme or assonance. This does not appear in the earliest Tamil literature, but by the end of the Śaṅgam period it was quite regular. The first syllable, or syllables, of each couplet must rhyme. Thus:

ISAIYĀD' eṇiṇum iyarrior ārrāl
AŚAIYĀDu nīrpadām āṇmai; isaiyuṅgal
KANDARirai alaikkūṇ kāṇal an taṇ śērppa
PENḌIRum vālārō marru."

"Though you fail, to work and struggle,
 unwaveringly steadfast—this is manliness.

Lord of the cool and lovely shore, where the waves shake the thorny
 groves!

Will not even women flourish in prosperity?"⁵⁰

This initial assonance, in some poems continued through four or more lines, is never to be found in the poetry of Sanskritic languages, or as far as we know, in that of any other language. Its effect, a little strange at first, rapidly becomes pleasant to the reader, and to the Tamil is as enjoyable as the end rhyme of European poetry.

We give a brief anthology of short poems and extracts from this wonderful literature.*

Here a mother tells of her son, who has gone to war.

“If you lean against the pillar of my little home
and ask the whereabouts of my son,
I reply, ‘I cannot tell you’.
Behold, like a tiger’s cavern of rock,
the womb that bore him!
You will find him on the field of war.”⁵²

The three following poems are attributed to the poetess Avvaiyār.

“It charms not like the harp,
it accords not with the time-beat,
it conveys no meaning,
but the prattling of a son
brings bliss to his father.
So, O King Neḍumāṇ Añji,
through the grace of your favour
my empty words are imbued with meaning.
O King, you have overcome the enemy’s forts,
though unscaleable were their walls.”⁵³

“To allow the little children of the village
to wash clean its white tusks,
the huge elephant will lie on the river bank.
O great King, you favour me like that!
But to approach an elephant in rut is death,
and you are death to your foes, O King!”⁵⁴

Here Avvaiyār compares the wealth of the luxurious king of Toṇḍai (Kāñcī) with that of her own warlike chief.

“Bedecked with peacock-feathers, garlanded with flowers,
fine are the Toṇḍai spears in the spacious armoury,
with their strong shafts, and sharp points bright with ghee.
The weapons of my king are blunt with fighting,
broken their points through parrying the thrusts of the foe.
The swordsmith’s forge is busy with repairs.
My king, when rich, freely gives food away,
when poor he messes with his men.
He is the head of the family of the poor,
yet great is he, with his sharp-pointed spear.”⁵⁵

* The first ten extracts are the work of Mr J. R. Marr, to whom we are much indebted for permission to use them. The other translations are our own, some made with the help of the many literal translations of Prof. P. T. S. Iyengar.⁵¹

"O bee, fair of wing, ever in search of flower-garlands,
tell me not what I fain would hear, but what you really saw!
Among all the flowers you know is any more fragrant
than the tresses of my lady of the close-set teeth?
Graceful as the peacock she dwells, rich in love, with me!"⁵⁶

"Ever anew aches my heart!
Again and again I brush off the burning tears.
My love, once peaceful at my side, grows restless.
My heart aches!"⁵⁷

"In the gathering night
hushed of speech all men sweetly sleep.
Devoid of wrath,
countless people in the world are resting.
I alone sleep not!"⁵⁸

Here a mother asks an ascetic the whereabouts of her daughter,
who has eloped with her lover. The sage offers her this consolation:

"Save to the wearer of its scent,
of what use is the sandalwood tree,
even to the mountains amid which it was born?
If you ponder the matter, it is so with your daughter.

"Except to the wearer of it
of what avail is the highly prized white pearl,
even to the sea in which it was reared?
If you ponder the matter, it is so with your daughter."⁵⁹

Here a girl speaks to her playmate:

"What bright bracelets you have! Do listen!
As I was playing in the road
he kicked over my mud castle with his foot,
and snatched the garland from my head,
and ran away with my striped ball.
How he teased me, the naughty boy!

"Another day my mother and I
were together, when a voice called out:
'Whoever's at home, please give me some water!'
Mother said to me: 'My dear,
fill the gilded vessel, and give him water to drink!'
I went out, not knowing who it was.
He caught my wrist, with the bangles on, and squeezed it,
and I was frightened, and cried out:

'Mother, just look what he's done!'
 She was very upset, and hurried down,
 but I told her he'd hiccups because of the water.
 He looked at me as if he could kill me,
 but then the rogue made friends with a smile."⁶⁰

Here a newly married girl makes her first attempts at cooking:

"Her fingers, slender as the *kāndaḥ* blossom, had been squeezing the new curds.

Her clothes had not been washed since she wiped her fingers on them.
 The appetizing steam had got into her lily-like eyes.

Yet, as she rubbed them, he just said, 'The curry you've cooked is delicious.'

He of the bright brow was most pleased with what he was eating."⁶¹

Striking touches of natural description often illumine the rather monotonous panegyrics:

"Though the milk turn sour, though day turn to night,
 though the path of the Vedas lead men astray,
 may you stand unshaken, long famed, with loyal
 supporters, that, in the foothills of the mountains,
 the large-eyed mother doe with her small-headed fawn
 may sleep secure at evening by the flame of the three fires
 of hermits who perform hard penances."⁶²

.

"Unfailing in the hard tasks of war,
 O king, like death, for whom there is no cure,
 though the earth be moved from her place, your name is eternal—
 you, whose legs wear golden anklets, whose broad breast
 is spread with drying sandal-paste!
 In an uninhabited land, a land of bitter hardship,
 a land without water, a land of long tracks,
 your valiant warriors fight, unerring in their archery,
 gazing afar, with their hands hung over their eyes.
 There, in the silk-cotton tree, where roads diverge,
 the eagle, with trim feathers and crooked beak,
 wails over the new cairns of those who have shot their arrows."⁶³

Here a girl consoles her lovelorn friend:

" 'The toiling fishermen catch the shoals
 in their close-meshed nets, and the soft-headed prawn,
 thin as the cassia bud in the forest.

" 'Like hunters who chase the deer in the woods
 young fishermen chase in the waste of the waters
 the saw-toothed shark, and return with meat.

“ ‘They return to the shore and unload on the sand,
where the wind plays wild across the salt pans,
and soon the street of the fishing village
will ring with the wheels of your lover’s chariot.’ ”⁶⁴

A young man praises his sweetheart’s cookery:

“ ‘At every post before the house
is tied the gentle calf of a crooked-horned buffalo.
There dwells my sweetheart, curving and lovely,
languid of gaze, with big round earrings,
and little rings on her tiny fingers.

“ ‘She has cut the leaves of the garden plantain
and split them in pieces down the stalk
to serve as platters for the meal.
Her eyes are filled with the smoke of cooking.
Her brow, as fair as the crescent moon,
is covered now with drops of sweat.
She wipes it away with the hem of her garment
and stands in the kitchen, and thinks of me.

“ ‘Come in then, if you want a good meal!
You’ll see her smile and show her tiny
sharp teeth, whom I long to kiss.’ ”⁶⁵

A village festival:

“The farmers who harvest rice in the hot sun
now leap into the waves of the clear sea.
The sailors, captains of stout craft,
drink strong liquor and dance for joy,
as they clasp the bright-bangled hands of women
who wear garlands of clustering *punnai*. . . .

“In the cool woods, where the bees seek flowers,
women, bright-bangled and garlanded, drink
the juice of the palm and the pale sugar-cane,
and the juice of the coconut which grows in the sand,
then running they plunge into the sea.”⁶⁶

A poignant description of famine:

“The hearth has forgotten cooking :
It is overgrown with moss and mould.
The woman, thin with hunger,
has breasts like wrinkled bladders.
Their nipples are quite dry,
but the child chews them, weeping.
She looks down at his face
and tears hang on her lashes.”⁶⁷

Our final quotation from the "Eight Anthologies" is the plaint of a neglected wife:

"My garment smells of ghee and frying curry,
and is stained with dirt and lampblack.

"My shoulders stink with the sweat of the child
whom I carry upon them and feed at my breast.

"I cannot face my lord, who, in gay attire,
rides in his car to the street of the harlots."⁶⁸

The next stratum of Tamil literature shows much greater Āryan influence. Āryan religious ideas and practices, not unknown even in the Eight Anthologies, had by now been thoroughly grafted on to the original Tamil heritage, and Jaina influence is prominent. "The Eighteen Minor Works" (*Padīṇṅkilkanakku*) are largely gnomic and moralizing in character, the two most famous being the *Tiruk-kural*, and the *Nālaḍiṻār*. The former, sometimes called the "Bible of the Tamil Land" is a series of brief metrical proverbs on many aspects of life and religion, and we have already quoted some of its aphorisms (p. 339). We add a few others of a more secular type.

"Vain is the kingdom where are all good things
but no love between ruler and ruled."

"Even the hermit ceases his penance
if the husbandman folds his arms."

"Earth laughs in scorn
at those who plead poverty."

"No food is sweeter than rice-gruel,
when you have worked for it."

"Wide as the sea is the joy of love,
but wider still the sorrow of parting."

"Love is stronger than wine,
for the very thought of it intoxicates."

"Sweethearts delight in a lover's quarrel
for the greater delight of making it up."⁶⁹

Nālaḍiṻār is more formal and literary in style, and contains verses of much merit and high ethical content.

- “Better hatred than the friendship of fools.
 Better death than chronic illness.
 Better to be killed than soul-destroying contempt.
 Better abuse than praise undeserved.”
-
- “True housekeeping is to eat a meal
 sharing, as far as may be, with friend and foe alike.
 The useless men who eat their food alone
 will never pass the gate of heaven.”
-
- “Though you feed him with care from a golden dish
 a dog will always prefer carrion.
 Though you deal with the base as you would with the good
 their deeds will always show them up.”
-
- “Hillmen remember their lovely hills.
 Farmers remember their fertile fields.
 The good remember another’s kindness.
 The base recall only fancied slights.”
-
- “As a scroll read by one who well understands it,
 as wealth to the man of generous spirit,
 as a sharp sword in a warrior’s hand,
 is the beauty of a faithful wife.”
-
- “To those who once embraced their lovers
 whose broad chests were hung with garlands,
 when their loved ones are away
 the thunder sounds like a funeral drum.” 70

By the 6th century Āryan influence had penetrated the whole of the Tamil land, and her kings and chiefs worshipped and supported the gods of Hinduism, Jainism and Buddhism. The indigenous style of poetry was rapidly altering under the influence of Sanskrit, and Tamil poets took to writing long poems which they called by the Sanskrit name *kāvya*. The earliest and greatest of these is “The Jewelled Anklet” (*Śilappadigāram*), which is still very different from Sanskrit poetry. Though written for an educated audience and in faultless literary style it is near to the life of the people; it is by comparison realistic, dealing with the lives of two ordinary folk enmeshed in unhappy circumstance, and, unlike the Sanskrit courtly “epic”, it sounds a note of true tragedy.

The traditional author of the poem was Ilaṅgōvaḍigaḷ, a grandson of the great Cōḷa king Karikāḷaṅ, who lived in the 1st or 2nd century A.D. The tradition is certainly false, and the poem is several

centuries later. Its author, whoever he was, though a great poet, was not a great storyteller. His tale was well known to his hearers, and he could afford to be irritatingly allusive and terse in important narrative passages, and linger lovingly over interesting description. He successfully drew together all the themes of earlier Tamil poets and welded them into a whole, in the framework of the story of the luckless Kōvalaṇ and Kaṇṇagi. Rightly this poem and Kambaṇ's *Rāmāyaṇam* are looked on as the national Epics of the Tamil people. We give an outline of the story, with a translation, considerably abridged, of its climax, which has a grimly baroque force and splendour, unparalleled elsewhere in Indian literature. It is imbued with both the ferocity of the early Tamils and their stern respect for justice, and, incidentally, throws much light on the character of early Tamil kingship.

Kōvalaṇ, the son of a wealthy merchant of the city of Pugār or Kāviri-pattinam, married Kaṇṇagi, the lovely daughter of another merchant. For some time they lived together happily, until, at a festival at the royal court, Kōvalaṇ met the dancer Mādavi, and fell in love with her. He bought her favours and in his infatuation forgot Kaṇṇagi and his home. Gradually he spent all his wealth on the dancer, even to Kaṇṇagi's jewels. At last he was penniless, and returned repentantly to his uncomplaining wife. Their only fortune was a precious pair of anklets, which she gave to him willingly. With these as their capital they decided to go to the great city of Madurai, where Kōvalaṇ hoped to recoup his fortunes by trade.

On their arrival at Madurai they found shelter in a cottage, and Kōvalaṇ went to the market, to sell one of Kaṇṇagi's anklets. But the queen of Neduñjeliyaṇ, king of the Pāṇdyas, had just been robbed of a similar anklet by a wicked court jeweller. The jeweller happened to see Kōvalaṇ with Kaṇṇagi's anklet, and immediately seized it and informed the King. Guards were sent to apprehend Kōvalaṇ, who was cut down immediately, without trial. When the news was brought to Kaṇṇagi she fainted away; but she quickly recovered and, with her eyes ablaze with anger, she went out into the town, carrying the remaining anklet in her hand as proof of her husband's innocence.

“Chaste women of Madurai, listen to me!

Today my sorrows cannot be matched.

Things which should never have happened have befallen me.

How can I bear this injustice?’ . . .

“All the folk of the rich city of Madurai

saw her, and were moved by her grief and affliction.

In wonder and sorrow they cried:

‘Wrong that cannot be undone has been done to this lady!

- ““Our King’s straight sceptre is bent!
What can this mean?
Lost is the glory of the King Over Kings,
the Lord of the Umbrella and Spear! . . .
- ““A new and a mighty goddess
has come before us,
In her hand a golden anklet!
What can this mean?
- ““This woman afflicted and weeping
from her lovely dark-stained eyes
is as though filled with godhead!
What can this mean?’
- “Thus, raising loud accusing voices,
the people of Madurai befriended and comforted her,
and among the tumultuous throng
some showed her her husband’s body.
- “She, the golden vine, beheld him,
but her he could not see. . . .
- “Then the red-rayed sun folded his fiery arms
and hid behind the great mountain,
and the wide world
was veiled in darkness.
- “In the brief twilight
Kannagi cried aloud
and the whole city
echoed her wailing.
- “In the morning she had taken the wreath from his neck
and decked her hair with its flowers;
in the evening she saw him lying
in a pool of his own blood.
- “But he saw not the agony of her grief
as she mourned in sorrow and wrath. . . .
- ““Are there women here? Are there women
who could bear such wrong
done to their wedded lords?
Are there women here? Are there such women?

“‘Are there good men here? Are there good men
who cherish their children
and guard them with care?
Are there men here? Are there such men?’

“‘Is there a god here? Is there a god
in this city of Madurai, where the sword of a king
has slain an innocent man?
Is there a god here? Is there a god?’

“‘Lamenting thus she clasped her husband’s breast,
and it seemed that he rose to his feet and said,
‘The full-moon of your face has faded,’
and he stroked her face with his hands.

“‘She fell to the ground, sobbing and crying,
and clasped her lord’s feet with her bangled hands;
and he left behind his human form
and went, surrounded by the gods.

“‘And, as he went, he said,
‘My darling, you must stay!’
‘Surely this
was a vision,’ she cried.

“‘I will not join my lord
till my great wrath is appeased!
I will see the cruel King,
and ask for his explanation!’

“‘And she stood on her feet,
her large eyes full of tears,
and, wiping her eyes,
she went to the gate of the palace.

“‘I saw, alas, I saw in a dream
the sceptre fall and the royal umbrella.
The bell at the palace gate rang of itself,
while the whole heaven shook in confusion!

“‘A darkness swallowed the sun,
a rainbow glowed in the night,
and a burning meteor
crashed to the earth by day.’

“‘Thus spoke the Queen,
and took her maids and her bodyguard,
and went to the King on the lion-throne,
and told him her evil dream.

“Then came a cry from the gate:
 ‘Ho, Gatekeeper! Ho, Gatekeeper!!
 Ho, Gatekeeper of the King who has lost wisdom,
 whose evil heart has swerved from justice!!

“‘Tell the King that a woman with an anklet,
 an anklet from a pair of tinkling anklets,
 a woman who has lost her husband,
 is waiting at the gate.’”

“And the gatekeeper went to the King and said:
 ‘A woman waits at the gate.
 She is not Korravai, goddess of victory,
 with triumphant spear in her hand. . . .

“‘Filled with anger, boiling with rage,
 a woman who has lost her husband,
 an anklet of gold in her hand,
 is waiting at the gate.’”

Kaṇṇagi was then admitted to the King’s presence.

“‘Cruel King, this I must say. . . .

“‘My lord Kōvalaṇ came
 to Madurai to earn wealth,
 and today you have slain him
 as he sold my anklet.’

“‘Lady,’ said the King,
 ‘it is kingly justice
 to put to death
 an arrant thief.’”

Then Kaṇṇagi showed her anklet to the King. On comparing it very carefully with the remaining anklet of the pair belonging to the Queen, he realized that Kōvalaṇ had been innocent.

“When he saw it the parasol fell from his head
 and the sceptre trembled in his hand.
 “‘I am no king,’ he said,
 ‘who have heeded the words of the goldsmith.

“‘I am the thief. For the first time
 I have failed to protect my people.
 Now may I die!’
 [And he fell to the ground, dead.]

Then Kannagi said to the Queen:

“‘If I have always been true to my husband
I will not suffer this city to flourish,
but I will destroy it as the King is destroyed!
Soon you will see that my words are true!’

“And with these words she left the palace,
and cried out through the city, ‘Men and women
of great Madurai of the four temples,
listen! Listen you gods in heaven!

“‘Listen to me, you holy sages!
I curse the capital of the King
who so cruelly wronged
my beloved lord!’

“With her own hand she tore the left breast from her body.
Thrice she surveyed the city of Madurai,
calling her curse in bitter agony.
Then she flung her fair breast on the scented street. . . .

“And the burning mouth of the Fire-god opened
as the gods who guarded the city closed their doors. . . .

“The high priest, the astrologer and the judges,
the treasurer and the learned councillors,
the palace servants and the maids,
stood silent and still as painted pictures.

“The elephant-riders and horsemen,
the charioteers and the foot-soldiers
with their terrible swords, all fled from the fire
which raged at the gate of the royal palace. . . .

“And the street of the sellers of grain,
the street of the chariots, with its bright-coloured garlands,
and the four quarters of the four classes
were filled with confusion and flamed like a forest on fire. . . .

“In the street of the singing girls
where so often the tabor had sounded
with the sweet gentle flute and the tremulous harp . . .
the dancers, whose halls were destroyed, cried out:

“‘Whence comes this woman? Whose daughter is she?
A single woman, who has lost her husband,
has conquered the evil King with her anklet,
and has destroyed our city with fire!’” 71

At last the patron goddess of the city interceded with Kaṇṇagi, and she agreed to withdraw her curse, and the fire abated. Weak with loss of blood from her self-amputated breast, Kaṇṇagi struggled to a hill outside the city, where, after a few days, she died, and was reunited with Kōvalaṇ in heaven. Meanwhile the news of her death spread throughout the Tamil Land. She was deified, and temples raised and festivals held in her honour, and she became the patron goddess of wifely loyalty and chastity.

A little later than "The Jewelled Anklet" was composed its sequel *Maṇimēgalai*, attributed to the poet Śāttaṇ of Madurai. Though by tradition it is the earlier of the two all other evidence suggests the opposite, for it assumes the reader's knowledge of "The Jewelled Anklet", to which it is a sort of Buddhistic supplement. "The Jewelled Anklet", though containing many religious and moral lessons, was primarily written to tell a story, while in *Maṇimēgalai* the story is a mere framework for philosophical polemic, and the atmosphere of the narrative passages has some of the other-worldly formality of the courtly Sanskrit kāvya. The heroine, Maṇimēgalai, is the daughter of Kōvalaṇ, the hero of "The Jewelled Anklet", by the dancer Mādavi, who became a Buddhist nun on hearing of her former lover's death. The story tells of the love of Prince Udayakumāraṇ for Maṇimēgalai, and the miraculous preservation of her chastity. In the end she becomes a Buddhist nun like her mother, and most of the poem is taken up with her discussions with members of various sects, both Hindu and heterodox, and her triumphant refutation of their doctrines.

A third Tamil "epic", *Śivaga-sindāmaṇi*, describes the exploits of the hero Śivaga or Jivaka, a superman who excels in every art from archery to the curing of snake-bite, and who wins a new bride for his harem with every feat, only to become a Jaina monk after his many triumphs. The author was a Jaina, Tiruttakkadēvar. His work is fantastic and lacking in any contact with real life; its style is elegant and ornate, and much influenced by courtly Sanskrit. It is definitely later than the other two "epics".

By now Tamil poets were not satisfied with their own traditions, and translations and adaptations of many Northern works were made, the most notable of which is Kambaṇ's *Rāmāyaṇam*, composed in the 9th century. This great poem is still known and loved in the Tamil Land, and is by no means a mere translation of the original, for Kambaṇ adapts themes as he thinks fit, and here and there adds episodes of his own. It is noteworthy that in Kambaṇ's hands the demon Rāvaṇa frequently takes on the proportions of a heroic figure, and contrasts favourably with the rather weak and unimpressive Rāma. Like Milton, Kambaṇ was of the devil's party without knowing

it. The real glory of medieval Tamil literature, however, is undoubtedly the hymns of the Śaivite and Vaiṣṇavite devotional teachers, which are among the great religious literature of the world, and which we have discussed and quoted in another connexion (p. 330ff). Other than these, later Tamil literature produced little of the first order. The canon of the Tamil Śaivites contains work of merit (p. 334), but the adaptations of the Purāṇas and the lengthy commentaries on earlier literature, though not unimportant, need not be discussed here.*

The early literatures of Canarese, Telugu and Malayālam, which had begun to be written before the end of our period, are less important than that of Tamil, and need not detain us. They originated at a time when Āryan influence was already thoroughly entrenched, and, though containing many beauties, lack the originality of early Tamil poetry. Thus they cannot aspire to the importance of Tamil, which can claim one of the longest unbroken literary traditions of any of the world's living languages.

Folk Poetry †

The literatures which we have been discussing were all the work of literary schools with formal conventions and long traditions. Some poetry, obviously, is less formalized than that of classical Sanskrit, and here and there, notably in the verses of the Tamil anthologies and the Prākṛit *Saptaśataka*, we seem to catch echoes of folk-song and popular oral literature. No Indian writer, however, as far as we know, thought fit to record the folk-song of ancient India, which, if we are to judge by modern analogy, must have been plentiful and of high quality. But a few verses have been preserved in Chinese translation, which may well be the words of genuine folk-songs of pre-Gupta times.

That part of the Buddhist canon called *Samyutta Nikāya* (p. 267) was first translated into Chinese about A.D. 440, from a manuscript acquired in Ceylon by Fa-hsien in 411. At the end of the book occurs a section which is not to be found in the Pāli version as it exists at

* Perhaps the greatest literary figure in later Tamil was Vīramāmuṇivar (1680-1747), a pseudonym of Father Costanzio Beschi, an Italian Jesuit who taught for thirty-six years in the Tamil country. Like many early Christian missionaries, he lived in wholly Indian fashion and attained a complete mastery of the Tamil language and literary conventions. It is doubtful if any European before or since has gained so profound a knowledge of an Indian language. Beschi's long poem *Tēmbāvaṇi* tells stories from the Old and New Testaments in ornately beautiful Tamil. His style and the treatment of his themes were altogether in keeping with tradition, but the influence of Tasso has been traced in his work.

† The material for this section, together with the translations of the Chinese verses, has been provided by Dr Arthur Waley. We are much indebted to him for the honour of being permitted to publish them here for the first time.

present, but which must have been included in Fa-hsien's manuscript. Probably the verses here quoted were sung in India between the time of the codification of the Pāli canon in the 1st century B.C. (p. 266) and the beginning of the 5th century A.D.

The passage in question describes a monk, who hears the singing of various secular songs, and converts them to Buddhist purposes by comparatively slight alterations. Thus the first verse quoted is capped by the monk with a pious wish that he may gently flow to Nirvāṇa, and so on.

The song of a lady who got on badly with her "in-laws":

"O river Ganges, all I now want
is to go with your waters that flow gently to the sea;
that never again by my father- and mother-in-law
I may at every turn be scolded and abused."

The song of a melon-thief:

"Bright moon, I beg you not to come out.
Wait where you are till I have cut these melons.
But when I have got my melons safely away,
then come out or not, just as you please."

The song of a poor man:

"So long as I own just one pig,
and a single jar full of good wine,
one cup to pour the wine into,
and someone to fill my cup again and again—
so long as I own just as much as that,
there is nothing else that bothers me at all."

The song of a girl who, going to a tryst with her lover on a rainy night, slips and falls in the mud:

"The hair of my head is all loose and astray;
my lovely necklace has fallen in the deep mud.
My rings and bracelets are all broken and spoiled;
when I come to my lover, what shall I give him to wear?"

The song of a lover, picnicking with his mistress:

"With thoughts of love, all for our ease and pleasure,
we loiter under the shade of the green trees.
The running stream flows swift and clear,
the sound of my zither is very tuneful and sweet.
The spring weather is just right for our jaunt;
what happiness could there be greater than ours?"

Advice to a dove:

“Dove, my bird, you must lay up your stores—
sesamum-seed, rice, millet and the rest—
and take them to a tree on the very top of the hill,
and make yourself a nest-cavern high and bright.
Then when Heaven sends the rainy season
you will be sure of lodging, food and drink.”

X

EPILOGUE: THE HERITAGE OF INDIA

THE IMPACT OF THE WEST

INDIA'S ancient culture did not perish before the onslaughts of the Muslims, as did that of Persia. Under the rule of some of the Delhi sultans of the Middle Ages there was persecution, and we read of temples being razed to the ground and brāhmaṇs put to death for practising their devotions in public; but in general the Muslims were reasonably tolerant, and at all times Hindu chiefs continued to rule in outlying parts of India, paying tribute to their Muslim overlords. Conversions to Islām were numerous, though only in a few regions were the majority of Indians persuaded to embrace the new faith. Hindu and Muslim lived side by side and, after a few centuries, the Hindus in those parts of India dominated by Muslims often accepted the situation as normal. In such conditions mutual influence was inevitable. Hindus began to learn Persian, the official language of their Muslim rulers, and Persian words found their way into the vernaculars. Well-to-do Hindu families often adopted the system of "strict parda" from the Muslims, and made their womenfolk veil their faces in public. The surviving Hindu kings borrowed new military techniques from the Muslims, learnt to employ cavalry with greater effect, and to use heavier armour and new types of weapon. One great religious teacher of medieval India, Kabīr (1440-1518), a poor weaver of Banāras, taught the brotherhood of Hindu and Muslim alike in the fatherhood of God, and opposed idolatry and caste practices, declaring that God was equally to be found in temple and mosque. Later, Nānak (1469-1539), a teacher of the Panjāb, taught the same doctrine with even greater force, and founded a new faith, that of the Sikhs, designed to incorporate all that was best of both Hinduism and Islām.

Nevertheless the Muslim invasions, and the enforced contact with new ideas, did not have the fertilizing effect upon Hindu culture which might have been expected. Hinduism was already very conservative when the lieutenants of Muhammad of Ghor conquered the Ganges Valley. In the Middle Ages, for every tolerant and progressive teacher there must have been hundreds of orthodox brāhmaṇs, who looked upon themselves as the preservers of the immemorial Āryan Dharma against the barbarians who overran the holy

land of Bhāratavarṣa. Under their influence the complex rules of the Hindu way of life became if anything stricter and more rigidly applied.

In the 16th and 17th centuries the Mughal emperors unified practically the whole of North India and much of the Deccan, and built up an empire such as had not been seen since the days of the Guptas. The Mughal period was one of great splendour, which has left its mark on India in the form of many lovely buildings, wherein Islāmic and Hindu motifs often blended in a perfect unity. The Tāj Mahal at Āgrā, the Mughal capital, is of course the most famous memorial of the times. Akbar (1555–1606), the contemporary of Queen Elizabeth I and the first of the four great Mughal emperors, fully realized that the Empire could only stand on a basis of complete toleration. All religious tests and disabilities were abolished, including the hated poll-tax on unbelievers. Rājput princes and other Hindus were given high offices of state, without conversion to Islām, and inter-communal marriages were encouraged by the example of the Emperor himself. If the policy of the greatest of India's Muslim rulers had been continued by his successors, her history might have been very different.

The great-grandson of Akbar, Aurangzeb (1659–1707), reversed the policy of toleration. Restrictions were placed on the free practice of Hindu rites and preferment at court was confined to orthodox Muslims; later the tax on non-Muslims was reimposed. After nearly a century of equality this was bitterly resented by many Hindus, especially by the chiefs, many of whom had loyally served the earlier Mughals. The main resistance came from the Western Deccan where, around Poona, the Marāthā chief Śivājī (1627–1680) laid the foundations of a new Hindu empire. At about the same time the Sikhs of the Panjāb, incensed at the new policy and the persecution of their leaders, reformed their faith, and were welded into a closely-knit martial brotherhood. When the aged Aurangzeb died the Mughal empire was virtually at an end.

Politically the 18th century was one of Hindu revival. Though the Marāthā successors of Śivājī could not build up a large, closely-knit empire their horsemen ranged far and wide over India, levying tribute from local chiefs, Hindu and Muslim alike. In the Panjāb towards the end of the century the Sikhs built an important kingdom, and almost everywhere Islām was on the defensive. But there was still no real cultural revival in Hinduism. Śivājī, a brilliant leader, a just ruler, and a statesman of consummate craft, was conservative in his outlook, and appeared to his contemporaries rather as a restorer of the old than as a builder of the new. Unlike Akbar, he had no fresh vision of a state transcending religious differences, though he learnt

much from the Mughals in statecraft and military science and respected the faith of his adversaries. The Marāthās did not encourage reforms in Hindu society, and the India of the 18th century was if anything more conservative than it had been in the days of the first Muslim invasions.

It was through the influence of Europe that revival came. Early in the 16th century the Portuguese founded the first European trading stations and settlements. They were followed by Dutch, British, Danes and French, and throughout the 17th century the number of European "factories" increased. In the 18th century, with the break-up of the Mughal empire, the Europeans began to take greater interest in local politics, and by the early 19th century the British East India Company had virtually pushed out its rivals and dominated most of the sub-continent. The comparative ease with which the British established their supremacy is a measure of the political decadence of India at the time. By the middle of the 19th century the whole of India was either directly ruled by Britain, or governed indirectly through petty princes with local autonomy. A new conqueror had come, a conqueror far more alien to the Hindu than the Muslims had been, with an aggressive culture and immense technical superiority.

Hindu society reacted at first to the British rulers as it had done to the Muslims, tending to withdraw itself even more into the closed circle of its ancient traditions, and there was no realization of a fundamental break with the past. From the orthodox point of view the British rulers of India constituted a caste, low in the social scale, which had succeeded in gaining political power. This caste had its own rules and customs which were not those of the Āryan, and should therefore not be imitated. The British readily accepted this position, and, after the 18th century, made few attempts at social contact. Any real friendship between Englishman and Indian became more and more difficult as the century progressed—in fact the Englishman in India unconsciously tended to adopt the ideas of social stratification of the Indians whom he ruled, and to look upon his own people as members of a class so exalted above the Indians that any close association with them was taboo. This attitude was strengthened by the Mutiny of 1857.

Nevertheless the presence of Europeans could not but have its effect. Except in certain parts of South India missionary activity in the 18th century was insignificant; but early in the 19th century the British evangelical conscience awakened to India, and missions and mission schools sprang up in all the larger towns. Meanwhile the Company felt a growing need for subordinate officers and clerks trained in English. Just as, in Muslim times, the Hindu desirous of

government employment was compelled to learn Persian, so now he had to learn English. Middle class Hindu fathers began to send their sons to European schools, despite the dangers of ritual impurity, and Western ideas began to affect the well-to-do educated Indian.

The Portuguese had succeeded in "westernizing" many of their Indian and Sinhalese subjects, and to this day Indian blood flows in the veins of some old Portuguese families; a few Indians in the service of France came to understand and admire the culture of their conquerors; but perhaps the first Indian to learn enough from the West to be able to hold his own with the best minds of Europe, and yet still to love and respect his own culture, was the Bengālī Rām Mohan Roy, the friend of Jeremy Bentham. Rām Mohan Roy, who was born in 1772 and died in England in 1833, advocated the frank acceptance of all that Europe had to teach, and the sect which looked to him for inspiration, the Brāhma Samāj, was in many ways closer to Christianity than to Hinduism. Never large in numbers, its influence was widespread.

From the days of Rām Mohan Roy young Indians, at first very few, but soon in greater numbers, began to come to England for education. The little band of Hindus educated on western lines, first in Bengal and then in other parts of India, tended to go further in the rejection of their own culture than their descendants; they were fully conscious of the degeneracy which beset their land, and many seem to have been rather ashamed of their Hindu background. The Mutiny, which was fundamentally reactionary, found no support among the tiny westernized intelligentsia. The Universities of Calcutta, Bombay and Madras, founded in 1857, the year of the Mutiny, at first paid scant attention to the ancient culture of India, but taught a predominantly Western curriculum through Western staff.

By the end of the 19th century, however, the situation had changed. A new generation began to realize that Hindu culture had much of permanent value, and that the slavish imitation of the West could not solve India's problems. New organizations gave expression to this outlook. The Ārya Samāj claimed to reform Hinduism by purging it of all later degenerate features and by a return to the Vedas, very liberally interpreted, and had considerable success. The Indian National Congress, founded in 1885, became the mouthpiece of Indian public opinion. Newspapers in English and the vernaculars multiplied.

Not only was Hindu culture largely rehabilitated in the eyes of intelligent Hindus, but it even began to make counter-propaganda. A few learned Europeans and Americans had long recognized the nobility of much ancient Indian religious thought. Now, through the

Theosophical Society (which, despite its claim to represent the quintessence of all religions, propagates a modernized Hinduism) and the Rāmākṛishṇa Mission, the voice of Hinduism was heard in the West. Swāmī Vivekānanda (1862–1902), a splendid speaker of great spiritual power and personal magnetism, preached Hinduism to large audiences in Europe and America and found willing hearers. Here and there Indians abjured the West root and branch, and fanatically defended even those aspects of Hinduism which had completely outlived their usefulness; but, despite these reactionaries, the new Hinduism was very different from the old.

Rām Mohan Roy had sounded the theme with his passionate advocacy of social reform; Vivekānanda repeated it with a more nationalist timbre, when he declared that the highest form of service of the Great Mother was social service. Other great Indians, chief of whom was Mahātmā Gāndhī, developed the theme of social service as a religious duty, and the development continues under Gāndhī's successors.

Mahātmā Gāndhī was looked on by many, both Indian and European, as the epitome of Hindu tradition, but this is a false judgement for he was much influenced by Western ideas. Gāndhī believed in the fundamentals of his ancient culture, but his passionate love of the underdog and his antipathy to caste, though not unprecedented in ancient India, were unorthodox in the extreme, and owed more to European 19th-century liberalism than to anything Indian. His faith in non-violence was, as we have seen, by no means typical of Hinduism—his predecessor in revolt, the able Marāṭhā brāhmaṇ B. G. Tilak, and Gāndhī's impatient lieutenant Subhās Chandra Bose, were far more orthodox in this respect. For Gāndhī's pacifism we must look to the Sermon on the Mount and to Tolstoy. His championing of women's rights is also the result of Western influence. In his social context he was always rather an innovator than a conservative. Though some of his colleagues thought his programme of limited social reform too slow, he succeeded in shifting the whole emphasis of Hindu thought towards a popular and equalitarian social order, in place of the hierarchy of class and caste. Following up the work of many less well-known 19th-century reformers Gāndhī and his followers of the Indian National Congress have given new orientation and new life to Hindu culture, after centuries of stagnation.

Today there are few Indians, whatever their creed, who do not look back with pride on their ancient culture, and there are few intelligent Indians who are not willing to sacrifice some of its effete elements that India may develop and progress. Politically and

economically India faces many problems of great difficulty, and no one can forecast her future with any certainty. But it is safe to predict that, whatever that future may be, the Indians of coming generations will not be unconvincing and self-conscious copies of Europeans, but will be men rooted in their own traditions, and aware of the continuity of their culture. Already, after only seven years of independence, the extremes of national self-denigration and fanatical cultural chauvinism are disappearing. We believe that Hindu civilization is in the act of performing its most spectacular feat of synthesis. In the past it has received, adapted and digested elements of many different cultures—Indo-European, Mesopotamian, Iranian, Greek, Roman, Scythian, Turkish, Persian and Arab. With each new influence it has somewhat changed. Now it is well on the way to assimilating the culture of the West.

Hindu civilization will, we believe, retain its continuity. The *Bhagavad Gītā* will not cease to inspire men of action, and the Upaniṣads men of thought. The charm and graciousness of the Indian way of life will continue, however much affected it may be by the labour-saving devices of the West. People will still love the tales of the heroes of the *Mahābhārata* and the *Rāmāyaṇa*, and of the loves of Duṣyanta and Śakuntalā and Purūravas and Urvaśī. The quiet and gentle happiness which has at all times pervaded Indian life where oppression, disease and poverty have not overclouded it will surely not vanish before the more hectic ways of the West.

Much that was useless in ancient Indian culture has already perished. The extravagant and barbarous hecatombs of the Vedic age have long since been forgotten, though animal sacrifice continues in some sects. Widows have long ceased to be burnt on their husbands' pyres. Girls may not by law be married in childhood. In buses and trains all over India brāhmaṇṣ rub shoulders with the lower castes without consciousness of grave pollution, and the temples, are open to all by law. Caste is vanishing; the process began long ago, but its pace is now so rapid that the more objectionable features of caste may have disappeared within a generation or so. The old family system is adapting itself to present-day conditions. In fact the whole face of India is altering, but the cultural tradition continues, and it will never be lost.

THE WORLD'S DEBT TO INDIA

We have said much about India's debt to other cultures, but we must make it clear that she has given as much as or more than she has taken. Let us summarize the world's debt to India.

The whole of South-East Asia received most of its culture from India. Early in the 5th century B.C. colonists from Western India settled in Ceylon, which was finally converted to Buddhism in the reign of Aśoka. By this time a few Indian merchants had probably found their way to Malaya, Sumātra, and other parts of South-East Asia. Gradually they established permanent settlements, often, no doubt, marrying native women. They were followed by brāhmaṇs and Buddhist monks, and Indian influence gradually leavened the indigenous culture, until, by the 4th century A.D., Sanskrit was the official language of the region, and there arose great civilizations, capable of organizing large maritime empires, and of building such wonderful memorials to their greatness as the Buddhist stūpa of Borobodūr in Java, or the Śaivite temples of Angkor in Cambodia. Other cultural influences, from China and the Islāmic world, were felt in South-East Asia, but the primary impetus to civilization came from India.

Indian historians, proud of their country's past, often refer to this region as "Greater India", and speak of Indian "colonies". In its usual modern sense the term "colony" is hardly accurate, however. Vijaya, the legendary Āryan conqueror of Ceylon, is said to have gained the island by the sword, but beyond this we have no real evidence of any permanent Indian conquest outside the bounds of India. The Indian "colonies" were peaceful ones, and the Indianized kings of the region were indigenous chieftains who had learnt what India had to teach them.

Northwards Indian cultural influence spread through Central Asia to China. Faint and weak contact between China and India was probably made in Mauryan times, if not before, but only when, some 2,000 years ago, the Han Empire began to drive its frontiers towards the Caspian did India and China really meet. Unlike South-East Asia, China did not assimilate Indian ideas in every aspect of her culture, but the whole of the Far East is in India's debt for Buddhism, which helped to mould the distinctive civilizations of China, Korea, Japan and Tibet.

As well as her special gifts to Asia, India has conferred many practical blessings on the world at large; notably rice, cotton, the sugar cane, many spices, the domestic fowl, the game of chess (p. 208), and, most important of all, the decimal system of numeral notation, the invention of an unknown Indian mathematician early in the Christian era (p. 495f). The extent of the spiritual influence of India on the ancient West is much disputed. The heterodox Jewish sect of the Essenes, which probably influenced early Christianity, followed monastic practices in some respects similar to those of Buddhism. Parallels may be traced between passages in the New Testament

and the Pāli scriptures.¹ Similarities between the teachings of western philosophers and mystics from Pythagoras to Plotinus and those of the Upaniṣads have frequently been noticed. None of these similarities, however, is close enough to give certainty, especially as we have no evidence that any classical writer had a deep knowledge of Indian religion. We can only say that there was always some contact between the Hellenic world and India, mediated first by the Achæmenid Empire, then by that of the Seleucids, and finally, under the Romans, by the traders of the Indian ocean. Christianity began to spread at the time when this contact was closest. We know that Indian ascetics occasionally visited the West, and that there was a colony of Indian merchants at Alexandria. The possibility of Indian influence on Neo-platonism and early Christianity cannot be ruled out.

Many authorities may doubt that Indian thought had any effect on that of the ancient West, but there can be no doubt of its direct and indirect influence on the thought of Europe and America in the last century and a half, though this has not received adequate recognition. This influence has not come by way of organized neo-Hindu missions. The last eighty years have seen the foundation of the Theosophical Society, of various Buddhist societies, and of societies in Europe and America looking for inspiration to the saintly 19th-century Bengālī mystic, Paramahansa Rāmakrishna, and his equally saintly disciple, Swāmī Vivekānanda. Lesser organizations and groups have been founded in the West by other Indian mystics and their disciples, some of them noble, earnest and spiritual, others of more dubious character. Here and there Westerners themselves, sometimes armed with a working knowledge of Sanskrit and first-hand Indian experience, have tried to convert the West to a streamlined Yoga or Vedānta. We would in no way disparage these teachers or their followers, many of whom are of great intellectual and spiritual calibre; but whatever we may think of the Western propagators of Indian mysticism, we cannot claim that they have had any great effect on our civilization. More subtle, but more powerful, has been the influence of Mahātmā Gāndhī, through the many friends of India in the West who were impressed by his burning sincerity and energy, and by the ultimate success of his policy of non-violence in achieving India's independence. Greater than any of these influences, however, has been the influence of ancient Indian religious literature through philosophy.

The pioneers of the Asiatic Society of Bengal quickly gained a small but enthusiastic following in Europe, and Goethe and many other writers of the early 19th century read all they could of ancient Indian literature in translation. We know that Goethe borrowed a device

of Indian dramaturgy for the prologue to "Faust" (p. 433n), and who can say that the triumphant final chorus of the second part of that work was not in part inspired by the monism of Indian thought as he understood it? From Goethe onwards most of the great German philosophers knew something of Indian philosophy. Schopenhauer, whose influence on literature and psychology has been so considerable, indeed openly admitted his debt, and his outlook was virtually that of Buddhism. The monisms of Fichte and Hegel might never have taken the forms they did if it had not been for Anquetil-Duperron's translation of the Upaniṣads and the work of other pioneer Indologists. In the English-speaking world the strongest Indian influence was felt in America, where Emerson, Thoreau and other New England writers avidly read all they could of Indian religious literature in translation, and exerted immense influence on their contemporaries and successors, notably Walt Whitman. Through Carlyle and others the German philosophers in their turn made their mark on England, as did the Americans through many late 19th-century writers such as Richard Jeffries and Edward Carpenter.

Though in the contemporary philosophical schools of Europe and America the monistic and idealist philosophies of the last century carry little weight, their influence has been considerable, and all of them owe something at least to ancient India. The sages who meditated in the jungles of the Ganges Valley six hundred years or more before Christ are still forces in the world.

It is today something of an anachronism to speak of European civilization or Indian civilization. Until very recently cultures were sharply divided, but now, when India is but a thirty hours' journey from London, cultural divisions are beginning to disappear. If a *modus vivendi* is reached between liberal democracy and communism, and civilization survives, the world of the future will have a single culture with, it is to be hoped, many local differences and variations. India's contribution to the world's cultural stock has already been very large, and it will continue and grow as, in her new freedom, her prestige and influence increases. For this reason if for no other we must take account of her ancient heritage in its successes and its failures, for it is no longer the heritage of India alone, but of all mankind.

APPENDIX I

COSMOLOGY AND GEOGRAPHY

THE universe of the Vedas was a simple affair—a flat circular earth below, a heaven above, through which sun, moon and stars moved, and between them the middle air (*antarikṣa*), the abode of birds, clouds and demigods. This picture of the world was much complicated by later religious thought.

Indian ideas on the origin and evolution of the universe are rather a matter of religion than of science and are considered elsewhere (p. 320ff). All Indian religions, however, show certain concepts of cosmology in common, which were fundamental presuppositions of Indian thought, and were strikingly at variance with the Semitic ideas which long influenced the thinking of the West—the universe is very old; its evolution and decline are cyclic, repeated ad infinitum; it is immensely large; and there are other universes beyond our own.

The Hindus believed that the universe was shaped like an egg—the *Brahmāṇḍa*, or Egg of Brahmā—divided into twenty-one zones or regions, of which the earth was seventh from the top. Above the earth were six heavens (not, as with the Greeks, associated with the planets), of increasing beatitude. Below earth were the seven stages of *Pātāla*, the nether world, which were the abode of *nāgas* and other mythical beings and were not thought of as in any way unpleasant. Below *Pātāla* lay *Naraka*, or purgatory, also divided into seven zones, which were of increasing misery, and inhabited by souls in torment. The universe hung in empty space, and was virtually isolated from other universes.

The cosmic schemes of the Buddhists and Jainas differed from this in many details, but in fundamentals were the same. All originally postulated a flat earth, but this was recognized by Indian astronomers to be incorrect early in the Christian era, and, though the idea of a flat earth remained for religious purposes, the learned realized, perhaps through the influence of Greek astronomy, that it was in fact spherical. Various estimates of its size were made, the most popular being that of Brahmagupta (7th century A.D.), who gave its circumference as 5,000 *yojanas*. Assuming Brahmagupta's *yojana* to be the short league of about $4\frac{1}{2}$ miles, this figure is not far out, and is as accurate as any given by ancient astronomers.

The modest spherical earth of the astronomers did not satisfy the theologians, however, and even later religious literature described the earth as a flat disc of enormous size. In its centre was Mount Meru, round which sun, moon and stars revolved. Around Meru were four continents (*dvīpa*), separated from the central peak by oceans, and named according to the great trees which stood on their shores opposite Meru. The southern continent, on which human beings dwell, had a *jambu* (rose-apple) as its distinctive tree, and it was therefore called *Jambudvīpa*. The southern zone of this continent,

Ivory Combs. Ceylon and South India. c. 17th century

Copper-plate Charter of King Dadda III of Broach. Dated A.D. 675

separated from the rest by the Himālayas, was "the Land of the Sons of Bharata" (*Bhāratavarṣa*), or India. *Bhāratavarṣa* alone was 9,000 *yojanas* across, and the whole of *Jambudvīpa* 33,000, or, according to some sources, 100,000 *yojanas*.

This fantastic geographical scheme was not the only one. In the *Purāṇas* *Jambudvīpa* is described as a ring around *Meru*, separated from the next continent, *Plakṣadvīpa*, by an ocean of salt. *Plakṣadvīpa* in turn forms a concentric circle round *Jambudvīpa*, and so on to make a total of seven continents, each circular and divided from its neighbour by an ocean of different composition—starting with *Jambudvīpa*'s salt ocean and moving outwards, of treacle, wine, ghee, milk, curds and fresh water respectively. This brilliantly imaginative picture of the world, which aroused the scorn of Lord Macaulay, seems to have been implicitly believed in by later Hindu theologians, and even the astronomers could not emancipate themselves from it, but adapted it to their spherical earth by making *Meru* the earth's axis, and the continents zones on the earth's surface.

The oceans of butter and seas of treacle formed an effective barrier to the growth of a true science of geography. The seven continents cannot in any way have been related to actual portions of the earth's surface, though some modern students have tried to identify them with parts of Asia, and, as far as is known, no attempt was made to collate the experience of travellers as practical geography. The astronomers gave fairly accurate longitudes of important places in India. In the early centuries of the Christian era *Alexandria* was known, and there are vague references to the city of the *Romakas* in astronomical works; but the geographical knowledge of the learned was of the vaguest description. Even within India distances and directions, as given in texts, are usually very inaccurate and vague. The conquerors who led armies thousands of miles on their campaigns, the merchants who carried their wares from one end of India to the other, and the pilgrims who visited sacred places from the Himālayas to Cape Comorin must have had a sound practical knowledge of Indian geography, while that of the seamen who sailed the ocean from *Socotra* to *Canton* must have been even wider; but there are few echoes of this knowledge in the literature of the time.

APPENDIX II

ASTRONOMY

One of the subsidiary studies (*vedāṅga*) of Vedic lore was *jyotiṣa*, a primitive astronomy designed mainly for the purpose of settling the dates and times at which periodical sacrifices were to be performed. The existing literature on this topic is comparatively late, and gives no true indication of India's astronomical knowledge in the Vedic period, though it is quite clear

from passages in the Vedic texts themselves that it was adequate for the practical purposes of the time. It is probable that even at this early period there was some Mesopotamian influence on Indian astronomical ideas, but this cannot be established with certainty. Virtually certain, however, is the influence of classical European astronomy, which was felt in the early centuries of the Christian era, if not before.

Several Greek words have become common in Sanskrit and in later Indian vernaculars through astronomy (p. 230), and other technical terms, not so widely known, are indisputably of Greek origin. Of the five astronomical systems (*siddhānta*) known to the 6th-century astronomer Varāhamihira one is called the *Romaka Siddhānta* and another the *Paulīśa Siddhānta*, a title which can only be reasonably explained as a recollection of the name of the classical astronomer Paul of Alexandria.

The new astronomy was adopted chiefly for purposes of prognostication; for the establishment of dates the old luni-solar calendar, based on simpler observations, was quite adequate. In earlier times Indians, though no less interested than other ancient peoples in foretelling the future, preferred to do so by the interpretation of dreams and omens (*utpāta*), and by physiognomy, birthmarks, the shape and size of the features, and other signs which were believed to give tokens of an individual's fate. The older systems of prognostication were not forgotten, but from Gupta times onwards they gave pride of place to astrology, which from that day to this has been implicitly believed in by nearly all Indians.

Until this great development of astronomical knowledge the heavens had been charted by means of the lunar mansions or *nakṣatras*, which were apparently known even in the time of the *R̥g Veda*. The moon's relation to the fixed stars changes through a cycle of approximately 27 solar days and $7\frac{3}{4}$ hours, and thus the heavens were divided into 27 portions, named according to the group of stars on the ecliptic (the apparent orbit of the sun) near which the moon passes on each day of its cycle. As the sidereal month is in fact nearly eight hours more than 27 days a twenty-eighth intercalary *nakṣatra* was added by later astronomers to correct the error.*

Western astronomy brought to India the signs of the zodiac, the seven-day week, the hour, and several other ideas. Thanks to their achievements

* The *nakṣatras* were: (1) *Aśvinī* (β and γ Arietis), (2) *Bharanī* (35, 39, and 41 Arietis), (3) *Kṛttikā* (Pleiades), (4) *Rohiṇī* (Aldebaran), (5) *Mṛgaśīras* (λ, φ¹, and φ² Orionis), (6) *Ārdrā* (α Orionis), (7) *Punarvasū* (α and β Geminorum), (8) *Puṣyā* (γ, δ, and θ Cancri), (9) *Āśleṣā* (δ, ε, η, ρ, and σ Hydræ), (10) *Maghā* (α, γ, ε, ζ, η, and μ Leonis), (11) *Pūrva-phalgunī* (δ and θ Leonis), (12) *Uttara-phalgunī* (β and 93 Leonis), (13) *Hastā* (α, β, γ, δ, and ε Corvi), (14) *Citrā* (Spica, α Virginis), (15) *Svātī* (Arcturus), (16) *Viśākhā* (α, β, γ, and ι Libræ), (17) *Anurādhā* (β, δ, and π Scorpionis), (18) *Jyēṣṭhā* (α, σ, and τ Scorpionis), (19) *Mūlā* (ε, ζ, η, θ, ι, κ, λ, μ, and υ Scorpionis), (20) *Pūrvāṣādhā* (δ and ε Sagittarii), (22) *Śravaṇā* (α, β, and γ Aquilæ), (23) *Dhanīṣṭhā* or *Śraviṣṭhā* (α, β, γ, and δ Delphinis), (24) *Satābhīṣaj* (γ Aquarii etc.), (25) *Pūrva-bhadrāpadā* (α and β Pegasi), (26) *Uttara-bhadrāpadā* (γ Pegasi and α Andromedæ), and (27) *Revatī* (ζ Piscium, etc.). The 28th *nakṣatra* was *Abhijit* (α, ε, and ζ Lyræ), which was placed between *Uttarāṣādhā* and *Śravaṇā*. It will be seen from this list that the ancient Indian system of constellations differed widely from that of the West.

in mathematics Indian astronomers made some advances on the knowledge of the Greeks, and passed their lore, with that of mathematics, back to Europe by way of the Arabs. As early as the 7th century the Syrian astronomer Severus Sebokht knew of the greatness of Indian astronomy and mathematics (p. vi), and the caliphs of Bāghdād employed Indian astronomers. One word of the terminology of medieval European astronomy, *aux*, the highest point of a planet's orbit, is certainly borrowed from the Sanskrit *ucca* through Arabic.

Like all ancient astronomy, that of India was restricted owing to ignorance of the telescope; but methods of observation were perfected which allowed very accurate measurement, and calculations were aided by the decimal system of numerals. We know of no remains of observatories of the Hindu period, but those of the 17th and 18th centuries, at Jaipur, Delhi and elsewhere, with their wonderfully accurate instruments, constructed on an enormous scale to minimize error, may well have had their ancient counterparts.

With the naked eye as their sole means of observation the Indians knew only the seven planets (*graha*) of the ancients—Sun (*Sūrya*, *Ravi*), Moon (*Candra*, *Soma*), Mercury (*Budha*), Venus (*Śukra*), Mars (*Maṅgala*), Jupiter (*Bṛhaspati*) and Saturn (*Śani*);* to these *grahas* two more were added, *Rāhu* and *Ketu*, the ascending and descending nodes of the moon.† At the beginning of each æon all the planets were believed to commence their revolutions in line, and to return to the same position at the end of it. The apparently irregular course of the planets was explained on the hypothesis of epicycles, as in classical and medieval astronomy. Unlike the Greeks, the Indians believed that the planets had equal real motion, and that their apparently different angular motion was due to their different distances from the earth.

For purposes of calculation the planetary system was taken as geocentric, though Āryabhaṭa in the 5th century suggested that the earth revolved round the sun and rotated on its axis; this theory was also known to later astronomers, but it never affected astronomical practice. The precession of the equinoxes was known, and calculated with some accuracy by medieval astronomers, as were the lengths of the year, the lunar month, and other astronomical constants. These calculations were reliable for most practical purposes, and in many cases more accurate than those of the Greco-Roman world. Eclipses were forecast with accuracy and their true cause understood.

* The names of the planets had many synonyms, some of which were evidently borrowed from the Greek, e.g. *Ara*, *Ares*, or *Mars*.

† At the "Churning of the Ocean" (p. 302) a demon named *Rāhu* stole some of the *amṛta*. Viṣṇu destroyed his body, but as he had tasted of the divine drink he had become immortal. His head and tail survive for ever in the heavens, as *Rāhu* and *Ketu*, and the head causes eclipses by trying to swallow the planets. Of course the astronomers did not believe this myth, and some texts explicitly reject it.

APPENDIX III

THE CALENDAR

In recording dates the basic unit was not the solar day, but the *tithi*, or lunar day, approximately thirty of which formed a lunar month (i.e. the four phases of the moon) of about $29\frac{1}{2}$ solar days. The month was divided into two halves (*pakṣa*) of fifteen tithis each, beginning with the full (*pūrṇimāvāsya*) and new (*amāvāsya* or *bahulāvāsya*) moons respectively. The fortnight beginning with the new moon was called the bright half (*śuklapakṣa*) and the other the dark half (*kṛṣṇapakṣa*). According to the system followed in Northern India and much of the Deccan the month began and ended with the full moon, while in the Tamil country the month generally began with the new moon. The Hindu calendar is still in use throughout India for religious purposes.

The tithi might begin at any time of the solar day. For the practical purpose of recording dates that tithi current at sunrise was supposed to prevail for the whole day and gave that day its number in the pakṣa. If a tithi began just after sunrise and ended before the sunrise of the next day, it was expunged, and there was a break in the numerical sequence of days.

The year normally contained twelve lunar months:

Caitra (March–April), *Vaiśākha* (April–May), *Jyaiṣṭha* (May–June), *Āṣāḍha* (June–July), *Śrāvaṇa* (July–August), *Bhādrapada* or *Praṣṭhapada* (August–September), *Āśvina* or *Āsvayuja* (September–October), *Kārttika* (October–November), *Mārgaśīrṣa* or *Āgrahāyana* (November–December), *Pauṣa* or *Taiṣa* (December–January), *Māgha* (January–February) and *Phālguna* (February–March).^{*} According to the usual systems of reckoning the year began with Caitra, but it was sometimes taken as beginning with Kārttika or another month.

A group of two months formed a season (*ṛtu*). The six seasons of the Indian year were: *Vasanta* (Spring, March–May), *Grīṣma* (Summer, May–July), *Varṣā* (The Rains, July–September), *Śarad* (Autumn, September–November), *Hemanta* (Winter, November–January) and *Śiśira* (the Cool Season, January–March).

Twelve lunar months make only about 354 days, and the problem of the discrepancy between the lunar and solar years was solved very early; sixty-two lunar months are approximately equal to sixty solar months, and so every thirty months an extra month was added to the year, as in Babylonia. This leap-month was generally inserted after Āṣāḍha or Śrāvaṇa and called second (*dvitīya*) Āṣāḍha or Śrāvaṇa. Thus every second or third year contains thirteen months, and is some twenty-nine days longer than the others.

^{*} The names of the months in early times were as follows: *Madhu*, *Mādhava*, *Śukra*, *Śuci*, *Nabhas*, *Nabhasya*, *Iṣa*, *Ūrja*, *Sahas*, *Sahasya*, *Tapas*, *Tapasya*. The Vedic names are sometimes found in later poetry.

The Hindu calendar, though quite efficient, is thus rather cumbrous, and is so different from the solar calendar that it is impossible to reduce dates from one to the other without very complicated calculations or lengthy tables. It is even impossible to establish at a glance the month in which a given Hindu date falls with any certainty.

Indian dates are usually given in the order—month, pakṣa, tithi, the abbreviations *śudi* and *badi* being used for the bright and dark halves of the month; e.g. *Caitra śudi* 7 means the seventh day from the new moon of the month Caitra.

The solar calendar, imported with Western astronomy, was also known from Gupta times onwards though it did not oust the old luni-solar calendar until recent years. Where solar dates are given in early records they are usually mentioned for extra accuracy, with the prevailing nakṣatra of the day in question, after the regular luni-solar date. In the solar calendar the months are named after the signs of the zodiac, which are literal or nearly exact translations of their Greek originals: *Meṣa* (Aries), *Vṛṣabha* (Taurus), *Mithuna* (Gemini), *Karkāṭa* (Cancer), *Simha* (Leo), *Kanyā* (Virgo), *Tulā* (Libra), *Vṛścika* (Scorpio), *Dhanus* (Sagittarius), *Makara* (Capricornus), *Kumbha* (Aquarius) and *Mīna* (Pisces). With the solar calendar the seven-day week was also introduced, the days being named after their presiding planets as in the Greco-Roman system: *Ravivāra* (Sunday), *Somavāra* (Monday), *Maṅgalavāra* (Tuesday), *Budhavāra* (Wednesday), *Bṛhaspativāra* (Thursday), *Śukravāra* (Friday) and *Śanivāra* (Saturday).

ERAS

Until the 1st century B.C. there is no good evidence that India had any regular system of recording the year of an event by dating in a definite era like the *A.U.C.* of Rome or the Christian era of medieval and modern Europe. Early inscriptions are dated if at all in the regnal year of the ruling king. The idea of dating over a long period of time from a fixed year was almost certainly introduced into India by the invaders of the North-West, who have left the earliest inscriptions thus dated in India. Unfortunately the Indians did not adopt a uniform era, and a number of systems of dating were in use from that time onwards, the chief of which, in order of importance, are as follows:

The Vikrama Era (58 B.C.), traditionally founded by a king called Vikramāditya, who drove the Śakas out of Ujjayinī and founded the era to celebrate his victory. The only king who both took the title Vikramāditya and drove the Śakas from Ujjayinī was Candragupta II, who lived over 400 years later than the beginning of the Vikrama era, and so the legend is certainly false. In the earliest inscriptions using this era, all from Western India, it is called simply *Kṛta* ("established"), or "handed down by the Mālava tribe". Some authorities believe that many inscriptions of the Śakas

and Pāhlavas of North-West India are to be read in this era, and that it was founded by Azes, one of their early kings; but this is by no means certain. This era was most popular in North India. Its year began originally with the month Kārttika, but by medieval times Vikrama years began in the bright half of Caitra in the North, and in the dark half of the same month in the Peninsula.

The Śaka Era (A.D. 78) was, according to tradition, founded by a Śaka king who occupied Ujjayinī 137 years after Vikramāditya. This era may in fact have been founded by Kaniṣka, and was certainly used early in the 2nd century A.D. by the "Western Satraps", who ruled Mālwa, Kāthiāwār and Gujarāt. Thence the use of the era spread through the Deccan and was exported to South-East Asia.

The Gupta Era (A.D. 320) was probably founded by Candragupta I, and its use was continued by the Maitraka dynasty of Gujarāt for some centuries after the Gupta empire fell.

The Harṣa Era (A.D. 606), founded by Harṣavardhana of Kānyakubja, was popular in Northern India for a century or two after his death.

The Kalacuri Era (A.D. 248), perhaps founded by a small dynasty called the Traikūṭaka, was current in Central India down to the Muslim invasion.

Other eras of local or temporary importance were the *Lakṣmaṇa Era* of Bengal (A.D. 1119), wrongly said to have been founded by King Lakṣmaṇa Sena; the *Saptarṣi* or *Laukika Era*, current in Kashmīr in the Middle Ages, and recorded in cycles of one hundred years, each cycle commencing seventy-six years after each Christian century; the *Licchavi* and *Nevār Eras* of Nepāl (A.D. 110 and 878); the *Kollam Era* of Malabār (A.D. 825); and the *Era of Vikramāditya VI Cālukya* (A.D. 1075). The *Era of the Kaliyuga* (3102 B.C., v. p. 39 above) was often used for religious dates and rarely for political. In Ceylon a *Buddha Era* from 544 B.C. was in use from an uncertain date, when it probably replaced an earlier reckoning from 483 B.C. The Jains used an *Era of Mahāvīra*, reckoned from 528 B.C. The two latter eras, together with the *Vikrama* and *Śaka Eras*, are still in use for religious purposes, but the others are extinct.

In reducing dates in Indian eras to the Christian era it must be remembered that the year, according to most reckonings, begins with the month of Caitra, which usually commences in the middle of March. Thus the months Māgha and Phālguna, and generally the second half of Pauṣa, occur in the Christian year after that in which the Hindu year began. Dates were usually given in expired years; this was sometimes explicitly stated (e.g. "when 493 years had passed from the establishment of the tribe of the Mālavas"), but more often taken for granted. In medieval dates it is best to assume an expired year, even when this is not specified, unless there is special reason to believe otherwise.

The following table will be useful for reducing Indian dates to the Christian era:

Era	First 9½ months approx. (assuming the year to begin with Caitra)		Second (usually dark) half of Pausa, and the whole of Māgha and Phālguna
<i>Vikrama</i>	current	subtract 58	57
	expired	„ 57	56
<i>Śaka</i>	current	add 77	78
	expired	„ 78	79
<i>Kalacuri</i>	current	add 247	248
	expired	„ 248	249
<i>Gupta</i>	current	add 319	320
	expired	„ 320	321
<i>Harṣa</i>	current	add 605	606
	expired	„ 606	607

APPENDIX IV

MATHEMATICS

Through the necessity of accurately laying out the open-air site of a sacrifice Indians very early evolved a simple system of geometry, but in the sphere of practical knowledge the world owes most to India in the realm of mathematics, which were developed in Gupta times to a stage more advanced than that reached by any other nation of antiquity. The success of Indian mathematics was mainly due to the fact that the Indians had a clear conception of abstract number, as distinct from numerical quantity of objects or spatial extension. While Greek mathematical science was largely based on mensuration and geometry, India transcended these conceptions quite early, and, with the aid of a simple numeral notation, devised a rudimentary algebra which allowed more complicated calculations than were possible to the Greeks, and led to the study of number for its own sake.

In the earlier inscriptions of India dates and other numerals are written in a notation not unlike that of the Romans, Greeks and Hebrews, with separate symbols for the tens and hundreds. The earliest inscription recording the date by a system of nine digits and a zero, with place notation for the tens and hundreds, comes from Gujarāt, and is dated A.D. 695.* By this time, however, the new system had been heard of in Syria (p. vi),† and was being used as far afield as Indo-China. Evidently the system was in use among mathematicians some centuries before it was employed in inscriptions, the scribes of which tended to be conservative in their system of

* *Epigraphia Indica*, ii, 20.

† Some earlier authorities, disinclined to give India her due, have declared that none of these sources gives certain evidence of the existence of a sign for zero. But Āryabhaṭas' text implies a knowledge of it, and Severus Sebokht's "nine symbols" would be quite useless for expressing quantities over nine without a zero sign and place notation. The Maya of Central America had a vigesimal numeral system with positional notation long before this time, but it had, of course, no effect on the world at large (S. G. Morley, *The Ancient Maya*, London, 1946, p. 274).

recording dates; in modern Europe the cumbrous Roman system is still sometimes used for the same purpose. The name of the mathematician who devised the simplified system of writing numerals is unknown, but the earliest surviving mathematical texts—the anonymous “Bakshālī Manuscript”, which is a copy of a text of the 4th century A.D., and the terse *Āryabhaṭīya* of Āryabhaṭa, written in A.D. 499—presuppose it.

For long it was thought that the decimal system of numerals was invented by the Arabs, but this is certainly not the case. The Arabs themselves called mathematics “the Indian (art)” (*hindisat*), and there is now no doubt that the decimal notation, with other mathematical lore, was learnt by the Muslim world either through merchants trading with the west coast of India, or through the Arabs who conquered Sind in A.D. 712.

The debt of the Western world to India in this respect cannot be overestimated. Most of the great discoveries and inventions of which Europe is so proud would have been impossible without a developed system of mathematics, and this in turn would have been impossible if Europe had been shackled by the unwieldy system of Roman numerals. The unknown man who devised the new system was from the world’s point of view, after the Buddha, the most important son of India. His achievement, though easily taken for granted, was the work of an analytical mind of the first order, and he deserves much more honour than he has so far received.

Medieval Indian mathematicians, such as Brahmagupta (7th century), Mahāvīra (9th century) and Bhāskara (12th century), made several discoveries which in Europe were not known until the Renaissance or later. They understood the import of positive and negative quantities, evolved sound systems of extracting square and cube roots, and could solve quadratic and certain types of indeterminate equations. For π Āryabhaṭa gave the usual modern approximate value of 3.1416, expressed in the form of a fraction $\frac{62832}{20000}$. This value of π , much more accurate than that of the Greeks, was improved to nine places of decimals by later Indian mathematicians. Some steps were made in trigonometry, spherical geometry and calculus, chiefly in connexion with astronomy. The mathematical implications of zero (*śūnya*) and infinity, never more than vaguely realized by classical authorities, were fully understood in medieval India. Earlier mathematicians had taught that $\frac{x}{0} = x$, but Bhāskara proved that it was infinity. He also established mathematically what had been recognized in Indian theology at least a millenium earlier, that infinity, however divided, remains infinite, represented by the equation $\frac{\infty}{x} = \infty$.

APPENDIX V

PHYSICS AND CHEMISTRY

Ancient Indian ideas of physics were closely linked with religion and theology, and differed somewhat from sect to sect. As early as the time of the Buddha, if not before, the universe was classified by elements, of which

all schools admitted at least four—earth, air, fire and water. To these orthodox Hindu schools and Jainism added a fifth, *ākāśa*, which is generally translated “ether”. It was recognized that air was not of infinite extension, and the Indian mind, with its abhorrence of a vacuum, found it hard to conceive of empty space. The five elements were thought of as the mediums of sense impressions—earth of smell, air of feeling, fire of vision, water of taste, and ether of sound. Buddhists and Ājīvikas rejected ether, but the latter added life, joy and sorrow, which were thought of as in some way material, making a total of seven elements.

Most schools believed that the elements other than ether were atomic. Indian atomism was certainly independent of Greek influence, for an atomic theory was taught by Pakudha Kātyāyana, an older contemporary of the Buddha, and was therefore earlier than that of Democritus. The Jains believed that all atoms (*aṇu*) were identical, and that differences of the character of the elements were due to the manner in which the atoms were combined. Most schools, however, maintained that there were as many types of atom as there were elements.

The atom was generally thought to be eternal, but some Buddhists conceived of it not only as the minutest object capable of occupying space, but also as occupying the minutest possible duration of time, coming into being and vanishing almost in an instant, only to be succeeded by another atom, caused by the first. Thus the atom of Buddhism in some measure resembles the quantum of Planck. The atom was quite invisible to the human eye; the orthodox Vaiśeṣika school believed the single atom to be a mere point in space, completely without magnitude.

A single atom had no qualities, but only potentialities, which came into play when the atom combined with others. The Vaiśeṣika school, which specially elaborated atomic doctrines, and was the school of atomism *par excellence*, maintained that, before combining to form material objects, atoms made primary combinations of diads and triads. This doctrine of molecules was developed differently by Buddhists and Ājīvikas, who taught that in normal conditions no atoms existed in a pure state, but only combined in different proportions in a molecule (*saṃghāṭa*, *kalāpa*). Every molecule contained at least one atom of all four types, and obtained its character from the predominance of a given element. This hypothesis accounted for the fact that matter might show characteristics of more than one element: thus wax might melt and also burn, because its molecules contained proportions of water and fire. According to the Buddhists the molecules cohered by virtue of the atoms of water in each, which acted as adhesive.

Indian atomic theories were not, of course, based on experiment, but on intuition and logic. They were not universally held. The great theologian Śāṅkara (p. 328) did not believe in atoms and argued strongly against their existence. But the atomic theories of ancient India are brilliant imaginative explanations of the physical structure of the world; though it is probably mere coincidence that they agree in part with the theories of modern physics, they are nevertheless much to the credit of the intellect and imagination of early Indian thinkers.

Beyond this ancient Indian physics developed little. Without knowledge of an all-embracing law of gravity it remained in a rudimentary state, like all the physical systems of the ancient world. It was generally believed that the elements of earth and water tended to fall, and fire to rise, and it was recognized that solids and fluids alike generally expanded on heating, but no serious effort was made to study such phenomena experimentally. In the science of acoustics, however, India made real discoveries based on experiment, and the ear, highly trained by the phonetic study necessary for the correct recitation of the Vedas, learned to distinguish musical tones far closer than those of other early musical systems. Before the Christian era the octave was divided into twenty-two *śrutis*, or quarter-tones (p. 382), and their proportions were measured with great accuracy. It was recognized that differences of timbre were caused by overtones (*anurāṇana*), which varied with different instruments.

We know from the evidence of the Iron Pillar of Delhī (p. 219 f) and other sources that Indian metallurgists gained great proficiency in the extraction of metal from ore and in metal-casting, and their products were known and valued in the Roman Empire and the Middle East; but their knowledge appears to have been largely pragmatic, and had no counterpart in a highly developed science of metallurgy. Chemistry in ancient India was the handmaid, not of technology, but of medicine; her chemists did not share the interest of medieval Europe in transmuting base metal into gold, but apparently devoted most of their attention to making medicines, drugs to promote longevity, aphrodisiacs, poisons, and their antidotes. These medical chemists did succeed in producing many important alkalis, acids and metallic salts by simple processes of calcination and distillation, and it has even been suggested, without good basis, that they discovered a form of gunpowder.

In the Middle Ages Indian chemists, like their counterparts in China, the Muslim World and Europe, became engrossed in the study of mercury, perhaps through contact with the Arabs. A school of alchemists arose, who experimented with the wonderful fluid metal, and decided that it was the specific for all diseases, the source of perpetual youth, and even the surest means to salvation. In this infatuation with mercury Indian chemistry foundered, but not before it had passed many ideas on to the Arabs, who gave them to medieval Europe.

APPENDIX VI

PHYSIOLOGY AND MEDICINE

The Vedas show a very primitive stage of medical and physiological lore, but the basic textbooks of Indian medicine—the compendia of Caraka (1st–2nd centuries A.D.) and Suśruta (c. 4th century A.D.)—are the products

of a fully evolved system which resembles those of Hippocrates and Galen in some respects, and in others has developed beyond them. We have no medical texts of the intervening period, but there is little doubt that two factors encouraged medical knowledge—the growth of interest in physiology through the phenomena of yoga and mystical experience, and Buddhism. Like the Christian missionary of later times the Buddhist monk often served as a doctor among the layfolk from whom he begged his food; moreover he was encouraged to care for his own health and that of his fellow-monks, and his creed tended towards rationalism and a distrust of the medical magic of earlier times. The development of medicine was also probably stimulated by contact with Hellenic physicians, and the resemblances between Indian and classical medicine suggest borrowing on both sides. After Sūśruta Indian medicine developed little, except in the growing use of mercurial drugs, and of others such as opium and sarsaparilla, which were introduced by the Arabs. In its essentials the system practised by the *ayurvedic* physician of present day India remains the same.

The basic conception of Indian medicine, like that of ancient and mediæval Europe, was the humours (*doṣa*). Most authorities taught that health was maintained through the even balance of the three vital fluids of the body—wind, gall and mucus, to which some added blood as a fourth humour. The three primary humours were connected with the scheme of the three *guṇas*, or universal qualities (p. 324 f), and associated with virtue, passion and dullness respectively.

The bodily functions were maintained by the five “winds” (*vāyu*): *udāna*, emanating from the throat, and causing speech; *prāṇa*, in the heart, and responsible for breathing and the swallowing of food; *samāna*, fanning the fire in the stomach which “cooked” or digested the food, and dividing it into its digestible and indigestible parts; *apāna* in the abdomen, and responsible for excretion and procreation; and *vyāna*, a generally diffused wind, causing the motion of the blood and of the body generally. The food digested by the *samāna* became chyle, which proceeded to the heart, and thence to the liver, where its essence was converted into blood. The blood in turn was in part converted into flesh and the process was continued through the series fat, bone, marrow and semen; the latter, when not expelled, produced energy (*ojas*), which returned to the heart and was thence diffused over the body. This process of metabolism was believed to take place in thirty days.

Ancient Indian doctors had no clear knowledge of the function of the brain, and believed with most ancient peoples that the heart was the seat of intelligence. They realized, however, the importance of the spinal cord (p. 326 f), and knew of the existence of the nervous system, though it was not properly understood. The progress of physiology and biology was impeded by the taboo on contact with dead bodies, which much discouraged dissection and the study of anatomy, although such practices were not completely unknown.

Despite their inaccurate knowledge of physiology, which was by no means inferior to that of most ancient peoples, India evolved a developed empirical surgery. The cæsarian section was known, bone-setting reached a high

degree of skill, and plastic surgery was developed far beyond anything known elsewhere at the time. Ancient Indian surgeons were expert at the repair of noses, ears and lips, lost or injured in battle or by judicial mutilation. In this respect Indian surgery remained ahead of European until the 18th century, when the surgeons of the East Indian Company were not ashamed to learn the art of rhinoplasty from the Indians.

Though Indians very early conceived of the existence of microscopic forms of life, it was never realized that these might cause diseases; but if Indian surgeons had no true idea of antisepsis or asepsis they encouraged scrupulous cleanliness as they understood it, and recognized the therapeutic value of fresh air and light. The pharmacopœia of ancient India was very large, and comprised animal, vegetable and mineral products. Many Asiatic drugs were known and used long before their introduction into Europe, notably the oil of the *chaulmugra* tree, traditionally prescribed as a specific for leprosy, and still the basis of the modern treatment of the disease.

The physician was a highly respected member of society, and the *vaidyas* rank high in the caste hierarchy to this day. The rules of professional behaviour laid down in medical texts remind us of those of Hippocrates and are not unworthy of the conscientious doctor of any place or time. We quote part of the sermon which Caraka instructs a physician to preach to his pupils at a solemn religious ceremony to be performed on the completion of their apprenticeship.

"If you want success in your practice, wealth and fame, and heaven after your death, you must pray every day on rising and going to bed for the welfare of all beings, especially of cows and brāhmaṇs, and you must strive with all your soul for the health of the sick. You must not betray your patients, even at the cost of your own life. . . . You must not get drunk, or commit evil, or have evil companions. . . . You must be pleasant of speech . . . and thoughtful, always striving to improve your knowledge.

"When you go to the home of a patient you should direct your words, mind, intellect and senses nowhere but to your patient and his treatment. . . . Nothing that happens in the house of the sick man must be told outside, nor must the patient's condition be told to anyone who might do harm by that knowledge to the patient or to another." *

Under the patronage of the more benevolent kings and religious foundations free medical aid was given to the poor. Aśoka took pride in the fact that he had provided medicines for man and beast, and the traveller Fa-hsien, in the early 5th century A.D., made special note of the free hospitals maintained by the donations of pious citizens. Unfortunately we have no detailed descriptions of such establishments.

Veterinary medicine was also practised. The doctrine of non-violence encouraged the endowment of animal refuges and homes for sick and aged animals, and such charities are still maintained in many cities of India. The horse and elephant doctors were members of skilled and respected professions, much in demand at court, and texts on veterinary science survive from the Middle Ages.

* *Caraka Saṃhitā*, iii, 8, 7.

APPENDIX VII

LOGIC AND EPISTEMOLOGY

With such an intense interest in metaphysical problems and a tradition of lively debate and discussion it is not surprising that India developed her own distinctive system of logic. The earliest logical text is the *Nyāya Sūtras* of Gautama, perhaps composed in the early centuries of the Christian era, a series of brief aphorisms much commented on by later writers, and the foundation-text of the Nyāya, one of the six schools of orthodox philosophy (p. 323). Logic was not, however, confined to this one school, but was utilized and adapted by Hindu, Buddhist and Jaina alike.

One of the most important topics of Indian thought in this field was the question of *pramāṇa*, which may be translated "means of reliable knowledge". According to the later Nyāya schools there were four *pramāṇas*, perception (*pratyakṣa*), inference (*anumāna*), inference by analogy or comparison (*upamāna*), and "word" (*śabda*), the pronouncement of a reliable authority, such as the Vedas. The Vedānta school added intuition or presumption (*arthāpatti*) and non-perception (*anupalabdhi*), the latter an unnecessary scholastic refinement. The six categories overlapped somewhat, and the Buddhists generally included all forms of knowledge under the first two categories, while the Jains usually allowed only three, perception, inference and revelation. The materialists allowed only perception, and their opponents made short work of their efforts at proving by inference that inference could not give reliable knowledge.

It was probably in the study of the process of inference that schools of true logic arose. From the necessities of metaphysical discussion false arguments were analysed and classified; of these logicians recognized the chief fallacies of classical logic, such as *reductio ad absurdum* (*arthaprasaṅga*), circular argument (*cakra*), infinite regression (*anavasthā*), dilemma (*anyonyāśraya*), and *ignoratio elenchi* (*ātmāśraya*).

A correct inference was established by syllogism, of which the Indian form (*pañcāvayava*) was somewhat more cumbrous than the Aristotelian. Its five members were known as proposition (*pratijñā*), reason (*hetu*), example (*udāharaṇa*), application (*upanaya*) and conclusion (*nigamana*). The classical Indian example may be paraphrased as follows:

- (1) There is fire on the mountain,
- (2) because there is smoke above it,
- (3) and where there is smoke there is fire, as, for instance, in a kitchen;
- (4) such is the case with the mountain,
- (5) and therefore there is fire on it.

The third term of the Indian syllogism corresponds to the major premiss of that of Aristotle, the second to Aristotle's minor premiss, and the first to his conclusion. Thus the Indian syllogism reversed the order of that of classical logic, the argument being stated in the first and second

clauses, established by the general rule and example in the third, and finally clinched by the virtual repetition of the first two clauses. The "example" (in the above syllogism the kitchen) was generally looked on as an essential part of the argument, and helped to strengthen its rhetorical force. Evidently this elaborate system of syllogism is the outcome of much practical experience in discussion. Three-membered syllogisms were admitted by the Buddhists, who rightly rejected the fourth and fifth members of the orthodox syllogism as tautological.

The basis of the generalization (for example "where there is smoke there is fire") on which every inference rests was believed to be the quality of universal concomitance (*vyāpti*). The nature and origin of this quality was much discussed, and its consideration led to theories of universals and particulars, which are too recondite for consideration in this book.

No treatment of Indian thought is complete without a brief reference to the remarkable epistemological relativity of Jainism. Jaina thinkers, and some other heterodox teachers also, explicitly rejected what in classical logic is called the law of the excluded middle. For the Jaina there were not merely the two possibilities of existence and non-existence, but seven. Thus we may affirm (1) that an object, say a knife, exists as a knife. We may further say (2) that it is not something else, say a fork. But it exists as a knife and does not exist as a fork, and so we may declare of it (3) that in one aspect it is and in another it is not. From another point of view (4) it is indescribable; its ultimate essence is unknown to us and we cannot posit anything final about it—it is inexpressible. By combining this fourth possibility with the three former ones we obtain three further possibilities of predication—(5) it is, but its nature is otherwise indescribable, (6) it is not, but its nature is indescribable, and (7) it both is and is not, but its nature is indescribable. This system of seven aspects of predication is known as *syādvāda* ("the doctrine of 'maybe'"), or *saptabhaṅgi* ("the sevenfold division").*

As well as *syādvāda* the Jainas had another sevenfold system of predication known as *nayavāda*, the theory of standpoints, or ways of approaching an object of observation or study. The first three of these are connected with the object itself (*dravyārthika*), and the latter four with its modifications and the words used to describe it (*paryāyārthika*). (1) A mango tree may be considered simultaneously as an individual having a definite size and shape and as a member of the species "mango tree"; (2) it may be treated merely as a representative of the "universal" mango tree, and as corresponding to the general concept of a mango tree, without taking its individual qualities into account; or (3) it may be considered merely as an individual, without taking note of its specific qualities. Further it may be thought of (4) as it is at the present moment, for instance as bearing ripe fruit, without any regard to its past as a sapling or its future as firewood. (5) We may think of it from the point of view of its name "mango", considering all the

* The Sanskrit terms for the seven aspects are: (1) *syādasti*, (2) *syānnāsti*, (3) *syādaśtinnāsti*, (4) *syādavaktavya*, (5) *syādaśtyavaktavya*, (6) *syānnāstyavaktavya*, and (7) *syādaśtinnāstyavaktavya*.

synonyms of that name, and their implications. These synonyms may be subtly differentiated, and (6) we may consider their nuances and connotations. Finally (7) we may consider an object in its relation to a given epithet; thus by referring to a hero as a "lion" we mentally abstract all his unlionlike qualities, and think of him only as a being of strength and courage.* Some Jaina schools rejected the last three standpoints, which are hardly consistent with the first four, being rather semantic in character than epistemological.

Modern logicians might make short work of these rather pedantic systems of ontological and epistemological relativity, but they have a fundamental quality of breadth and realism, implying a full realization that the world is more complex and subtle than we think it, and that what is true of a thing in one of its aspects may at the same time be false in another.

APPENDIX VIII

WEIGHTS AND MEASURES

MEASURES OF WEIGHT

The basic weight of ancient India was the *raktikā*, the bright red seed of the *guñja* (*abrus precatorius*), which was conventionally reckoned at about 1·83 grains (·118 grams). Many sources give series of weights rising from this, which are not wholly consistent, and show that standards varied very widely with time and place.

The goldsmith's scale given by Manu, which was probably the most widely followed, was:

5 <i>raktikās</i>	= 1 <i>māṣa</i> ,
16 <i>māṣas</i>	= 1 <i>karṣa</i> , <i>tolaka</i> , or <i>suvarṇa</i> ,
4 <i>karṣas</i>	= 1 <i>pala</i> ,
10 <i>palas</i>	= 1 <i>dharāṇa</i> .

The weight of the *pala* was thus approximately $1\frac{1}{2}$ oz., or 37·76 gms. Of heavier weights the chief were the *prastha*, usually given as of 16 *palas*, and the *droṇa* of 16 *prasthas*. The *prastha* was thus approximately 21 oz., and the *droṇa* $21\frac{1}{4}$ lb.

MEASURES OF LENGTH

The commonest table, omitting microscopic measurements, was:

8 <i>yava</i> (barleycorns)	= 1 <i>aṅgula</i> (finger's breadth, $\frac{3}{4}$ in.)
12 <i>aṅgulas</i>	= 1 <i>vitasti</i> (span, 9 ins.)
2 <i>vitastis</i>	= 1 <i>hasta</i> or <i>aratni</i> (cubit, 18 ins.)
4 <i>hastas</i>	= 1 <i>daṇḍa</i> (rod) or <i>dhanus</i> (bow, 6 ft.)
2,000 <i>dhanus</i>	= 1 <i>krośa</i> (cry) or <i>goruta</i> (cow-call, $2\frac{1}{4}$ miles)
4 <i>krośas</i>	= 1 <i>yojana</i> (stage, 9 miles approx.).

* The Sanskrit names of the seven *nayas* are: (1) *naigama*, (2) *saṅgraha*, (3) *vyavahāra*, (4) *rjusūtra*, (5) *śabda*, (6) *samabhirūḍha*, and (7) *evambhūta*.

Though most sources give the *crośa* (in modern Indian languages *kos*) as of 2,000 *daṇḍas* the *Arthaśāstra* gives it as of only 1,000, the *yojana*, which was the commonest measure of long distances in ancient India, being thus of only $4\frac{1}{2}$ miles. It is therefore clear that there were at least two *yojanas*, and distances as given in texts are thus very unreliable. It would seem that for practical purposes the shorter *yojana* was more often used than the longer, especially in earlier times.

MEASURES OF TIME

Ancient Indian learned men devised a detailed terminology for minute intervals of time, which had little relation to everyday life and must be looked on as a flight of fancy. The longer measurements in most general use were:

18 <i>nimeśas</i> (winks)	= 1 <i>kāṣṭhā</i> ($3\frac{1}{5}$ secs.),
30 <i>kāṣṭhās</i>	= 1 <i>kalā</i> ($1\frac{3}{5}$ mins.)
15 <i>kalās</i>	= 1 <i>nāḍikā</i> or <i>nālikā</i> (24 mins.)
30 <i>kalās</i> or 2 <i>nāḍikās</i>	= 1 <i>muhūrta</i> or <i>kṣaṇa</i> (48 mins.)
30 <i>muhūrtas</i>	= 1 <i>aho-rātra</i> (day and night, 24 hours).

A measurement frequently used, but not consistent with this system, was the *yāma* or watch, one-eighth of a day and night, or three hours. In some sources, however, the *yāma* is given as three *muhūrtas*, or one-tenth of a day and night. The hour (*horā*) was introduced from the West in the Gupta period and was used in astronomy, but was not widely employed in everyday life.

For longer measures of time see p. 492 ff.

APPENDIX IX

COINAGE*

EARLY PUNCH MARKED COINS

Uninscribed punchmarked coins were minted from the 6th century B.C. onwards, and were in circulation for many centuries. Among the earliest silver specimens are those in the shape of a small bent bar, the largest of which, the *śatamāna*, weighed 180 grains. Half, quarter and half-quarter *śatamānas* are attested.

The basic silver punchmarked coin of the usual type was the *kārṣāpaṇa* or *paṇa*, of 57·8 grains. The *māṣa* or *māṣika* weighed one-sixteenth of this, or 3·6 grains. Various intermediate weights are attested, as well as large silver coins of 30 and 20 *māṣas* and small half-*māṣa* pieces.

Punchmarked copper coins were generally based on a different standard—a *māṣa* of 9 grains and a *kārṣāpaṇa* of 144. Quarter-*māṣas* in copper, or

* We are much indebted to Dr. A. K. Narain, Reader in Indology at Banāras Hindu University, for providing the material for this appendix.

kākiṇīs (2·25 grains) are attested, as well as large coins of 20, 30 and 45 copper *māṣas*.

Only one gold punchmarked coin is known, and it must be assumed that gold was very rarely minted before the beginning of the Christian era.

INDO-GREEK COINS

The earlier Greek kings minted coins according to the Attic standard, based on the drachm of 67·2 grains and the obol ($\frac{1}{8}$ drachm) of 11·2 grains. Silver coinage of this type ranges from hemiobols to the very large double decadrachms, struck by a king Amyntas, which have recently been found in Afghānistān. After their southward expansion the Greeks adopted a reduced weight, with silver coins of 152 and 38 grains.

The Greek kings issued numerous copper coins, but their metrology is not clear. Gold coins must have been very rare. There exist a very large 20 stater piece of the Bactrian usurper Eucratides and rare staters of a few other kings.

Śaka and Pahlava coins in silver and copper follow the reduced Indo-Greek standard.

KUṢĀṆA COINS

These were minted in gold and copper. The gold *dīnāras* or *suvarṇas* were based on the Roman denarius and were of 124 grains. Double and quarter *dīnāras* were also issued. The copper coins were large, of from 26 to 28 *māṣas*, or 240 to 260 grains.

PRE-GUPTAN AND GUPTAN COINS

A large range of coins in silver and copper, of very varied weight and character, was issued by the indigenous kings, tribes and cities of Northern India in the centuries immediately preceding and following the beginning of the Christian era. The Sātavāhanas of the Deccan also issued coins of lead and potin (base silver), while the Śakas of Gujarāt, Mālwa and the Western Deccan issued a distinctive series of coins in silver.

The gold coins of the Guptas (*dīnāra*) originally approximated to the Kuṣāṇa standard, but in the middle of the 5th century rose in weight to 144 grains, thus returning to the Indian standard of the copper *kāṣṭhapaṇa*. Gupta silver coins (*rūpaka*), based on those of the Śakas of Ujjayinī, weighed 32–36 grains. The metrology of Gupta copper coinage is obscure, and weights of from 3·3 to 101 grains are attested.

MEDIEVAL COINS

Gold coins (*suvarṇa*, *ṭaṅka*) were minted by only a few dynasties in the 11th century. These approximated to the Greek drachm standard of 67 grains. Silver coins (*dramma*, *ṭaṅka*) also conformed to this standard, and coins of $\frac{3}{4}$, $\frac{1}{2}$ and $\frac{1}{4}$ *dramma* are attested. Numerous types of copper coin were issued, of diverse metrology. The coinage of the medieval dynasties of the Peninsula was very varied and a full study of its metrology is yet to be made.

APPENDIX X

THE ALPHABET AND ITS PRONUNCIATION

The alphabet devised by ancient Indian phoneticians and adapted to all the chief Indian languages except Urdū is as follows:

I. VOWELS

a. (*simple*)

	short	long
guttural . . .	(1) <i>a</i>	(2) <i>ā</i>
palatal . . .	(3) <i>i</i>	(4) <i>ī</i>
labial . . .	(5) <i>u</i>	(6) <i>ū</i>
retroflex . . .	(7) <i>ṛ</i>	(8) <i>ṝ</i>
dental . . .	(9) <i>ḷ</i>	(10) <i>ḹ</i> *

(b) *diphthongs*

palatal . . .	(11) <i>e</i>
	(12) <i>ai</i>
labial . . .	(13) <i>o</i>
	(14) <i>au</i>

II. CONSONANTS

(a) *visarga*(15) *ḥ*(b) *anusvāra*(16) *ṁ*(c) *stopped consonants*

	unvoiced	unvoiced aspirate	voiced	voiced aspirate	nasal
guttural . . .	(17) <i>k</i>	(18) <i>kh</i>	(19) <i>g</i>	(20) <i>gh</i>	(21) <i>ṅ</i>
palatal . . .	(22) <i>c</i>	(23) <i>ch</i>	(24) <i>j</i>	(25) <i>jh</i>	(26) <i>ñ</i>
retroflex . . .	(27) <i>ṭ</i>	(28) <i>ṭh</i>	(29) <i>ḍ</i>	(30) <i>ḍh</i>	(31) <i>ṇ</i>
dental . . .	(32) <i>t</i>	(33) <i>th</i>	(34) <i>d</i>	(35) <i>dh</i>	(36) <i>n</i>
labial . . .	(37) <i>p</i>	(38) <i>ph</i>	(39) <i>b</i>	(40) <i>bh</i>	(41) <i>m</i>

(d) *semivowels*

palatal . . .	(42) <i>y</i>
retroflex . . .	(43) <i>r</i>
dental . . .	(44) <i>l</i>
labial . . .	(45) <i>v</i>

(e) *sibilants*

palatal . . .	(46) <i>ś</i>
retroflex . . .	(47) <i>ṣ</i>
dental . . .	(48) <i>s</i>

(f) *aspiration*(49) *h*

* This vowel is the invention of the paṇḍits, and never occurs in practice. The short vocalic *ḷ* occurs only in the root *klp* and its derivatives.

To these letters the Dravidian languages and Sinhalese add the short vowels *ě* (between *ī* and *e*) and *ō* (between *e* and *o*). Sinhalese has also the additional vowels *ā* and *ā̃* (between *ā* and *i*). Tamil adds the consonants *l*, *ḷ* (not the same as the vocalic *ḷ* of Sanskrit), *r*, and *ṇ* at the end of the alphabet; these letters cannot stand at the beginning of a word. The Tamil alphabet omits the aspirate letters and several others, and the unvoiced letters serve to express the sound of the voiced. The system of transliteration used for Tamil words and quotations in this book does not show this peculiarity.

It will be seen that this alphabet is methodical and scientific, its elements classified first into vowels and consonants, and then, within each section, according to the manner in which the sound is formed. The gutturals are formed by the constriction of the throat at the back of the tongue, the palatals by pressing the tongue flat against the palate, the retroflex by turning up the tip of the tongue to touch the hard palate, the dentals by touching the upper teeth with the tongue, and the labials by pursing the lips.

The vowels *ā*, *i*, *ī*, *u*, *ū*, *e*, *ai*, *o*, and *au* are pronounced approximately as in German or Italian, *e* and *o* being "close" sounds, as in German *beten* and *boten*, but short *a* has the dull sound of the English *shut*. In very early times *r* and the vocalic *ḷ* were pronounced approximately as are the second syllables of the words *water* and *bottle* by Americans, but before the Christian era they were sounded as *ri* and *lri*. The Sinhalese *ā* and *ā̃* are pronounced approximately as the vowels in the English *hat* and *hair* respectively. According to traditional phonetics *e* and *o* are classed as diphthongs and in Sanskrit are invariably long.

Of the two first consonants *h*, occurring only at the end of words or syllables, is a rough breathing, replacing an original *s* or *r*. It is a distinct emission of breath, often followed by a faint continuation of the preceding vowel. *Anusvāra*, or *m*, written in Indian scripts as a dot, is in part a mere abbreviation, representing a nasal sound before a stopped consonant. Thus *saṃdhi* is pronounced as *sandhi*, and *aṃga* as *aṅga*. Before semi-vowels, sibilants or *h* it had the effect of nasalizing the preceding vowel, as in French or Portuguese; thus *aṃśu* was pronounced very approximately as the French *un chou*. By many modern speakers *m* in this position is pronounced as the English *ng* in *sang*.

The distinction between the aspirate and unaspirate consonants is not immediately recognized by the European, but it is clear to the Indian. *K*, for instance, is pronounced without any noticeable emission of breath, and *kh* (written as one letter in Indian scripts) with a strong emission, as in the usual pronunciation of the English *c* in *come*. Thus the reader should avoid the temptation to pronounce *th* and *ph* as the initial sounds of the English *thing* and *phial*; they approximate to the sounds in *pothook* and *shepherd*. *C* is pronounced approximately as the second consonantal sound in the English *church*, and *ch* as the first sound in the same word, i.e., with a stronger emission of breath. *J* is pronounced as in English, and not as in German or French. A clear distinction is made between the retroflex or cerebral

consonants and the dental, though it is not very evident to the untrained English ear. The English *t* and *d* are nearer to the Indian retroflex *ṭ* and *ḍ* than to the Indian dentals *t* and *d*, which approximate to the corresponding sounds in Italian.

Modern Indians do not generally differentiate in speaking between *ś* and *ṣ*, and inscriptions show that the two sounds began to be confused at an early date. Both resemble *sh* in the English *shut*. Originally *ṣ* was pronounced, like the other retroflex consonants, with the tip of the tongue touching the top of the hard palate.

Of the special Tamil letters *ḷ* has the sound of an *l* with the tongue turned as far back as possible. Many modern Tamil speakers pronounce this letter rather like the *s* in the English *measure* or the French *j*, but more harshly. The consonantal *ḷ* (which also occurs in Vedic and some Prākṛits) is pronounced by placing the tongue on the top of the hard palate and flapping it forward; *r* at the end of a syllable is often pronounced as *t*; between two vowels it is approximately *dr*, and when doubled *tr*, while *ṛṛ* is usually pronounced as *ndr*; though a distinction formerly existed Tamil *ṛ* is in modern speech indistinguishable from *n*.

We have seen that Vedic Sanskrit, like Greek, had a tonic accent, but this, again as in Greek, disappeared very early from ordinary speech, its place being taken by a stress accent, as in most European languages. The stress is placed on the last prosodically long syllable of a word (i.e. a syllable containing either a long vowel or a short vowel followed by two consonants) other than the final syllable, which never has the accent. In a word with no long syllables the accent is on the first syllable. E.g. *sābhā*, *Himālaya*, *Śakuntalā*, *dvayava*. The stress is not as marked as in English.

APPENDIX XI

PROSODY

Like those of classical Europe the metres of Indian poetry are quantitative, based on the order of long and short syllables, and not, as in English, on stress. As in classical European languages a syllable was counted as long if it contained a long vowel (*ā*, *ī*, *ū*, *ṛ*, *e*, *o*, *ai* or *au*), or a short vowel followed by two consonants. The favourite stanza form at all times was of four lines or "quarters" (*pāda*), usually equal, and varying in length from eight to over twenty syllables each, with a full cæsuræ between the second and third quarters. Most of the metres of classical poetry were set in rigid patterns and not divided into feet, but broken only by one or two cæsuræ in each quarter. The metres of the Veda, however, and the epic *śloka* metre, allowed considerable variation.

Though most of the Vedic hymns are in stanzas of four quarters there are some with three or five divisions. Of the former, one, called *Gāyatrī*, is common, and is that of the famous *Gāyatrī* verse quoted on p. 162. It

consists of three sections of eight syllables each, the first four of which are free, while the last four have the cadence $\cup - \cup \simeq$.

The commonest Vedic stanza is *Triṣṭubh*, consisting of four quarters of eleven syllables each. The quarter normally has a cæsura after the fourth or fifth syllable, and is prevailingly iambic. The last four syllables of each quarter have the cadence $- \cup - \simeq$. For example:

*Índrasya nu víriāṇi prá vocam
yāni cakāra prathamāni vajrī.
Āhann Āhim, anu apās tatarda,
pra vakṣāṇā abhinat párvatānām.**

Similar to this, but with an extra syllable in each quarter, was the twelve-syllabled *Jagatī*, with the cadence $- \cup - \cup \simeq$.

In the later hymns of the *Rg Veda* a stanza of four eight-syllable quarters, called *Anuṣṭubh*, became popular. This was much the same as *Gāyatrī*, with a fourth line added, but there was considerable variation in the final cadence. For example:

*Sahásra-śīrṣā Púruṣaḥ,
sahasrákṣāḥ, saháśrapāt.
Sá bhūmim viśvato vṛtvā
áty atīṣṭhad daśāṅgulám.†*

From the *Anuṣṭubh* of the Vedas developed the *Śloka*, the chief epic metre of later times. This consisted of four quarters of eight syllables each, the first and third normally ending with the cadence $\cup - - \simeq$, and the second and fourth with $\cup - \cup \simeq$. Certain specified variations were allowed. As an example we quote the first verse of the account of Damayanti's svayaṃvara, translated on p. 409.

*Atha kāle śubhe prāpte,
tithau puṇye kṣaṇe tathā,
ājuhāva mahipālān
Bhīmo rājā svayaṃvare.*

The *śloka* metre was widely used for poetry of all kinds, especially for didactic and narrative verse. The courtly poets, however, favoured longer metres, with their quantities rigidly fixed in complicated rhythmic patterns, some with regular cæsuræ. Textbooks describe over 100 metres of this kind, many with fanciful names, but only some twenty or thirty were popular. Of these we mention a few of the most common.

Indravajra ("Indra's Thunderbolt"):

4 × 11: $- - \cup - - \cup \cup - \cup - \simeq$.

*Bhāgīrathī-nīrjhara-sikarāṇām
voḍhā muhuḥ kampīta-devadāruḥ
yad vāyur anvīṣṭamṛgaiḥ kirātair
āsevya bhinna-śikhaṇḍi-barhaḥ.‡*

* The first verse of the hymn to Indra (*R.V.* i. 32) translated on p. 400.

† The first verse of the "Hymn of the Primeval Man" (*R.V.* x. 90), in part translated on p. 240).

‡ *Kumāra Sambhava*, i, 15, translated on p. 421—"And the wind forever . . ."

Upendravajra (Secondary *Indravajra*), a variant of the above, with the first syllable short:

4 × 11: ◡ — ◡ — — ◡ ◡ — ◡ — ◡.

Quarter lines of *Indravajra* and *Upendravajra* were often combined in mixed stanzas. Such stanzas of varying metres were called *Upajāti*.

Vaṃśastha:

4 × 12: ◡ — ◡ — — ◡ ◡ — ◡ — ◡ ◡.

Indravāṃśa: like *Vaṃśastha*, but with a long first syllable:

4 × 12: — — ◡ — — ◡ ◡ — ◡ — ◡ ◡.

Vaṃśastha and *Indravāṃśa* were often combined in an *Upajāti* metre, e.g. the verses of Kālidāsa quoted on p. 422, n.

Vasantatilakā ("The Ornament of Spring"):

4 × 14: — — ◡ — ◡ ◡ ◡ — ◡ ◡ — ◡ — ◡.

*Adyāpi tām praṇayinīm mṛgaśāvakaḥśim
pīyūṣa-varṇa-kuca-kumbha-yugaṃ vahantīm
paśyāmy ahaṃ yadi punar dīvasāvasāne
svargāpavarga-vara-rājya-sukhaṃ tyajāmi.**

Mālīnī ("The Girl wearing a Garland"):

4 × 15: ◡ ◡ ◡ ◡ ◡ ◡ — — / — ◡ — — ◡ — ◡.

*Kim iha bahubhir uktair yukti-sūnyaiḥ pralāpair?
Dvayam api puruṣāṇāṃ sarvadā sevānīyam—
abhinava-mada-līlā-lālasaṃ sundarīnāṃ
stana-bhara-parikhinnaṃ yauvanaṃ vā vanaṃ vā.†*

Prthvī ("The Earth"):

4 × 17: ◡ — ◡ ◡ ◡ — ◡ — ◡ ◡ ◡ — ◡ — — ◡ ◡.

*Labheta sikatāsu tailam api yatnataḥ pīḍayan
pibec ca mṛgatṛṣṇikāsu salilaṃ pīpāsārditaḥ
kadācid api paryaṭaṇ chāṣa-viṣāṇam āśādayen,
na tu pratiniṣṭa-mūrkhā-jana-cittam ārādhayet.‡*

Mandākrāntā ("The Slow-stepper"):

4 × 17: — — — — / ◡ ◡ ◡ ◡ ◡ — / — ◡ — — ◡ — ◡.

An example of this metre is given on p. 419, n.

Śikhariṇī ("The Excellent Lady"):

4 × 17: ◡ — — — — / ◡ ◡ ◡ ◡ ◡ — — ◡ ◡ ◡ ◡.

*Yad' āsīd ajñānaṃ smara-timira-saṃskāra-janitaṃ
tadā dṛṣṭaṃ nārī-mayam idam aśeṣaṃ jagad api.
Idānim asmākaṃ paṭutara-vivekāñjana-juṣāṃ
samibhūtā dṛṣṭis tribhuvanam api Brahma manute.§*

* Bilhana, *Caurapañcāśikā*, 45, translated on p. 428: "Even today, if this evening . . ."

† Bhartṛhari, *Śṛṅgārasataka*, 53, translated on p. 426: "What is the use . . .?"

‡ Bhartṛhari, *Nīṭisataka*, 5: translated on p. 425: "You may if you squeeze hard enough . . ."

§ Bhartṛhari, *Vairāgyasataka*, 82, translated on p. 426: "When I was ignorant . . ."

Hariṇī ("The Doe"):

4 × 17: ◡ ◡ ◡ ◡ ◡ — / — — — — / ◡ — ◡ ◡ — ◡ ◡.

*Apara-jaladher Lakṣmīm yasmin Purīm Purabhit-prabhe
mada-gaja-ghaṭākārair nāvām śatair avamṛdati
jalada-pāṭalānikākīrṇaṃ navotpala-mecakaṃ
jalanidhir iva vyoma vyomnaḥ samo 'bhavad ambudhiḥ.**

Sārdūla-vikṛīḍita ("The Tiger's Sport"):

4 × 19: — — — ◡ ◡ — ◡ — ◡ ◡ ◡ — / — — ◡ — — ◡ ◡.

*Keśāḥ saṃyaminaḥ, śruter api paraṃ pāraṃgate locane,
cāntarvaktram api svabhāva-sucibhiḥ kīrṇaṃ dvijānāṃ gaṇaiḥ,
muktānāṃ sataśādhivāsa-ruciraṃ vakṣoja-kumbhadvayaṃ
cetthaṃ tanvi vapuḥ praśāntaṃ api te kṣobhaṃ karoty eva naḥ.†*

Sragdharā ("The Girl with a Garland"):

4 × 21: — — — — ◡ — — / ◡ ◡ ◡ ◡ ◡ ◡ — / — ◡ — — — ◡ ◡.

The verses of Bāṇa quoted on p. 427 are in this metre.

In a few rather rare metres the first and third quarters differ in length from the second and fourth. The commonest of these was *Puṣpitaṅgrā*:

2 × (12 + 13): ◡ ◡ ◡ ◡ ◡ ◡ — ◡ — ◡ — ◡ — ◡ /
◡ ◡ ◡ ◡ — ◡ ◡ — ◡ — ◡ — ◡ ◡.

*"Aham iha nivasāmi. Yāhi Rādhām,
anunaya madvacanena c' ānayethāḥ".
Iti Madhuripuṇā sakhī niyuktā,
svayam idam etya punar jagāda Rādhām.‡*

As well as metres of this type there are others, the scansion of which is based on the number of syllabic instants (*mātrā*) in each quarter-verse. The most common of these is *Āryā* ("The Lady"). This is divided into feet, each containing four instants, counting a prosodically short syllable as one and a long syllable as two instants (i.e. — —, — ◡ ◡, ◡ — ◡, ◡ ◡ —, or ◡ ◡ ◡ ◡). The first quarter of the *Āryā* stanza contains three such feet; the second, four and a half; the third, three, and the fourth three and a half, with an extra short syllable after the second foot. The whole of Hāla's *Saptaśataka* is written in this metre; for example:

*Bhaṇḍantīa taṇāim
sottuṃ diṇṇāi jāi pahīassa.
Tāi ccea pahāe
ajjā āaḍḍhaī ruantī.§*

* "Radiant as the god Śiva, he besieged Purī, the fortune of the Western Sea, with hundreds of ships, like elephants in rut, the dark blue sky, scattered with hosts of heavy clouds, looked like the sea, and the sea looked like the sky."

From a panegyric of King Pulakeśin II Cālukya in an inscription at Aihoḷe, Hyderābād, composed by Ravikīrti and dated A.D. 634 (*EI* vi, 8ff.).

† Bhartṛhari, *Śṛṅgāraśataka*, 12, translated on p. 425: "Your hair well combed . . ."

‡ The introductory verse to the lyric of Jayadeva's *Gīta Govinda*, translated on p. 428.

§ *Saptaśataka*, 379, translated on p. 461 "Last night with scorn . . ."

This verse is to be scanned as follows:

-- / - ◡ ◡ / -- /
 -- / -- / ◡ - ◡ / ◡ ◡ - / -
 -- / - ◡ ◡ / -- /
 -- / -- / ◡ / ◡ ◡ - / -.

The metres employed by Jayadeva in his *Gīta Govinda* are exceptional, although imitated by later poets. They are no doubt borrowed from popular song. The stanzas of the lyric quoted on p. 429, excluding the refrain, consist of four quarters of nine, eight, nine and ten syllables respectively, all of which are short except the last rhyming syllable in the first and third quarters and the penultimate in the second and fourth.

The prosody of Tamil poetry differs considerably from that of Sanskrit. In Tamil the basic unit is the "metrical syllable" (*aśai*), which may be a single syllable or a long syllable preceded by a short one. Two, three or four of these form a foot, of which a line of poetry may contain from two to six or occasionally more. Complicated rules, which cannot be discussed here, much restrict the order of syllables and feet in the line.

APPENDIX XII

THE GYPSIES

Among India's many gifts to the world we must include the Gypsies, who, with their music and dancing, have formed a romantic and colourful element in European life for over five centuries.

The European Gypsies have no recollection of their Indian origin, but have generally claimed to be Egyptians. The Russian Gypsies, it is said, even declare that their ancestors were a single soldier of the army of Pharaoh and a young girl, who escaped drowning when Moses led the Israelites over the Red Sea. This tradition of the Gypsies' Egyptian origin was for long taken at its face value, until, in 1763, a Hungarian protestant theological student, Stefan Vályi, published a brief paper pointing to the close similarity between the language of the Gypsies of his native plains and that of three Indian theological students whom he had met at the University of Leyden. It was long before the true significance of this fact was recognized, but it is now universally agreed that the Gypsy language, or Romani, is an Indo-Āryan one, and that the fact can only be accounted for by postulating that the Gypsies came from India.

The relationship of Romani to the languages of Northern India is very obvious, even to those with no linguistic training, for many of the commonest words of Romani are little different from those of India. Thus:

<i>Romani</i> *	<i>Indo-Aryan</i>	<i>English</i>
<i>Ek</i>	Sanskrit <i>eka</i> , Hindi <i>ek</i>	one
<i>dui</i>	Skt. <i>dva</i> , H. <i>do</i>	two
<i>trin</i>	Skt. <i>tri</i> , H. <i>tīn</i>	three
<i>štar</i>	Skt. <i>catvār</i> , H. <i>cār</i>	four
<i>pañci</i>	Skt. <i>pañca</i> , H. <i>pañc</i>	five
<i>šo</i>	Skt. <i>ṣaṣ</i>	six
<i>efta</i>	(Greek, ἑπτὰ)	seven
<i>ohto</i>	(Greek, ὀκτώ)	eight
<i>inea</i>	(Greek, ἐννέα)	nine
<i>deš</i>	Skt. <i>daśa</i>	ten
<i>biš</i>	H. <i>bīs</i>	twenty
<i>šel</i>	Skt. <i>śata</i>	hundred
<i>manuš</i>	Skt. <i>manuṣya</i>	man
<i>bal</i>	Skt. <i>bāla</i> , H. <i>bāl</i>	hair
<i>kan</i>	Skt. <i>kārṇa</i> , H. <i>kān</i>	ear
<i>nak</i>	H. <i>nāk</i>	nose
<i>yak</i>	Skt. <i>akṣa</i>	eye
<i>kalo</i>	Skt. <i>kāla</i>	black
<i>caco</i>	Skt. <i>satya</i> , H. <i>sac</i>	true, etc., etc.

Philologists have shown by the comparison of Romani with the Prākritis and modern Indian languages, that the Gypsies originated in the Ganges basin, which they left before the time of Aśoka (3rd century B.C.), to reside for several centuries in North-Western India. Probably even at this time they were wandering musicians and entertainers. In modern India there is a lowly caste of such people called *Doms*, attested since the early Middle Ages, and with this word the word *Rom*, by which the Gypsies universally designate themselves, is probably connected. In Syrian Romani it occurs as *Doum*, very close to the Indian form.

According to the 11th c. Persian poet Firdūsī, who collected many legends and traditions of pre-Muslim Persia in his "Book of Kings" (*Shāh-nāmah*), the 5th-century Sāsānian king Bahrām Gūr, invited ten thousand Indian musicians to his realm, and gave them cattle, corn and asses, that they might settle in the land and entertain his poorer subjects, who had been complaining that the pleasures of music and dance were reserved for the rich. But the musicians refused to settle; they ate the cattle and seed-corn which the king had given them, and wandered about the land like wolves or wild dogs.

Though Firdūsī's story may not be wholly accurate, it shows that low caste Indian musicians were well known in the Middle East at a very early time. With the Arab conquest of Sind in the early 8th century further groups of Indian entertainers must have found their way westwards and later have moved on to Africa and Europe. Folk called Athinganoi are recorded as living in Constantinople in A.D. 810, and later Byzantine records refer to these Athinganoi or Azinganoi as magicians and conjurors.

* These words are taken from Serboianu's grammar and glossary of Roumanian Romani (*Les Tsiganes*, Paris, 1930). His rather unscientific system of transliteration has been modified in accordance with the usual Indo-Āryan system.

These were probably the forerunners of the Tsigany bands who appeared in Central and Western Europe in the late Middle Ages. The earliest record of Gypsies in Europe other than in the Balkans is from the German city of Hildesheim, where a passing band is recorded in 1407. A great horde of Gypsies passed through Basel in 1422, under a chief who called himself Michael, Prince of Egypt. Within a few decades they had overrun all Europe; the earliest records show that they had all the characteristics of their descendants—they were careless, lazy, dirty and cheerful, skilled in metal work and tinkering, splendid musicians and dancers, their bodies bedecked with bright garments and jewellery, their menfolk cunning horse-dealers, their womenfolk telling fortunes, and both sexes losing no opportunity to pilfer from the unsuspecting *gorjo*. It was not long before the Gypsies began to feel the fierce persecution which they were to suffer in most parts of Europe down to the present day, when many Gypsies perished in the gas-chambers of the Third Reich.

From the many loan-words in the various dialects of Romani we may roughly trace the course of their migrations. All the Romani dialects of West and Central Europe contain many Greek and South Slavonic words, which prove that the ancestors of our western Gypsies dwelt long in the Balkans. The Spanish Gypsies appear to have arrived in their new homeland from two directions, a first immigration coming via Egypt and the north coast of Africa, no doubt during the Moorish occupation of southern Spain, and a second, later, over the Pyrenees.

Little but their language remains to connect the Gypsies with their original home, and even their speech is full of borrowings from almost every tongue of Europe and many of Asia. Though the Gypsies have always tended to marry their own kind, centuries of wandering have left their mark on the Gypsy type and there are now many fair Gypsies, though others, if suitably attired, would not seem out of place in a modern North Indian city. On analysis their music is that of the lands in which they dwell. Whether in Hungary, Roumania or Spain, it is based on local folk-song and dance. Unfortunately the English Gypsies have largely forgotten their traditional art, but when they sing they sing folk-songs and music-hall ballads; in Ireland the tinkers sing Irish folk-songs. Yet, wherever the Gypsies go, their musicians tend to give their music a character of its own. A predilection for ornamentation of the melody, especially with quarter-tones, a preference for the minor mode, a tendency to introduce progressions by augmented whole tones into their melodies, and a love of complex rhythm, are perhaps survivals of the Indian musical tradition which the first Romanis brought with them from their homeland. Some Gypsy folktales resemble those of India, but the same may be said of the traditional tales of every country of Europe. A few Gypsy customs and beliefs may be genuine Indian survivals. Though by no means a hygienically inclined people, the Gypsies have ideas of ritual purity and birth and death taboos which remind us of those of Hinduism. Thus a woman in childbirth is impure, and must bear her child outside her caravan or tent for fear of polluting it. Gypsy midwives are impure throughout their lives, and are taboo to all respectable

Gypsies, like the outcast village midwives of India. Corpses are also impure, and dying Gypsies are carried from their caravans to end their lives in the open air, for fear of pollution. The Gypsy taboo on horse-slaughters may have an Indian origin. But all these resemblances might well be accounted for otherwise.

The Gypsies have, in fact, forgotten their ancestry. In one respect, however, they have kept to the traditions of their homeland. Though they have adapted their ways to time and place, and have always been open to new influences, they are still governed by their own laws and their own code of morality. They have doggedly retained their individuality against persecution and persuasion alike—an independent social group, transcending regional and national boundaries, knit together by common customs, common means of livelihood, and common blood. In this respect they are Indian. They are a caste, as their Indian counterparts, the Doms, are a caste, and even the innovations of the Twentieth Century have not been able to destroy their caste solidarity.

A NOTE FOR THE READER WHO WISHES TO READ FURTHER

This book is primarily intended for those who know no Sanskrit; hence editions of original texts are not generally mentioned, but reference is made to translations wherever possible. As many Indian readers of this book will have little or no knowledge of European languages, English translations of works by continental scholars are referred to wherever they exist. Few of the books mentioned will be found in the ordinary English lending libraries, but most can be obtained by local librarians through the National Central Library for Students.

 A. B. KEITH. *Buddhist Philosophy in India and Ceylon*. Oxford, 1923.
 W. M. MCGOVERN. *Manual of Buddhist Philosophy*. London, 1923.
 E. CONZE. *Buddhism, its Essence and Development*. 2nd ed., Oxford, 1953.

(d) *Jainism, etc.*

- MRS. S. STEVENSON. *The Heart of Jainism*. Oxford, 1915.
 H. VON GLASENAPP. *Der Jainismus*. Berlin, 1926.
 W. SCHUBRING. *Die Lehre der Jainas*. Göttingen, 1926.
 A. GUERINOT. *La Religion Djaïna*. Paris, 1926.
 A. L. BASHAM. *History and Doctrines of the Ājīvikas*. London, 1951.

(e) *Hinduism*

- J. N. FARQUHAR. *A Primer of Hinduism*. London, 1912.
 L. D. BARNETT. *The Heart of India*. London, 1908.
 J. DOWSON. *A Classical Dictionary of Hindu Mythology and Religion*. 7th ed., London, 1950.
 E. WASHBURN HOPKINS. *Epic Mythology*. Strassburg, 1915.
 J. E. CARPENTER. *Theism in Medieval India*. London, 1921.
 H. C. RAYCHAUDHURI. *Early History of the Vaiṣṇava Sect*. 2nd ed., Calcutta, 1926.
 SIR R. G. BHĀNDĀRKAR. *Vaiṣṇavism, Śaivism and Minor Religious Sects*. Strassburg, 1913.
 H. W. SCHOMERUS. *Der Āiava Siddhānta*. Leipzig, 1912.
 ARTHUR AVALON. *Shakti and Shākta*. Madras, 1929.
 J. N. BANERJEA. *Development of Hindu Iconography*. Calcutta, 1946.
 T. A. GOPĪNĀTH RAO. *Elements of Indian Iconography*. 2 vols., Madras, 1914.

(f) *Christianity*

A. E. MEDLYCOTT. *India and the Apostle Thomas*. London, 1905.

G. MILNE RAY. *The Syrian Church in India*. Edinburgh, 1892.

Translations

LIN YUTANG and others. *The Wisdom of India*. London, 1949 (translations of both religious and secular literature, by various hands).

(a) *Vedic*

N. MACNICOL and others. *Hindu Scriptures*. London (Everyman), 1938.

R. T. H. GRIFFITH (tr.). *The Rig Veda*. 2nd ed., 2 vols., Benares, 1896-7.

F. MAX MÜLLER and H. OLDENBERG (tr.). *Vedic Hymns*. 2 vols., SBE xxxii, xlv, Oxford, 1891-7.

F. GELDNER (tr.). *Der Rig-veda*. 3 vols. Cambridge, Mass., 1951.

W. D. WHITNEY (tr.). *The Atharva Veda*. Cambridge, Mass., 1905.

J. EGGEING (tr.). *The Śatapatha Brāhmaṇa*. 5 vols., SBE xii, xxvi, xli, xliii, xlv. Oxford, 1882-1900.

F. MAX MÜLLER (tr.). *The Upaniṣads*. 2 vols., SBE i, xv, Oxford, 1879-82.

R. A. HUME (tr.). *Thirteen Principal Upanishads*. Oxford, 1921.

(b) *Buddhist*

All the more important texts of the Pāli Scriptures have been translated by various hands and published by the Pāli Text Society, London, with the exception of the following:

E. B. COWELL and others (tr.). *The Jātaka*. 6 vols., Cambridge, 1895-1907.

T. W. RHYS DAVIDS (tr.). *The Questions of King Milinda*. 2 vols., SBE xxxv-vi, Oxford, 1890-94.

Selections from Buddhist Scriptures

F. L. WOODWARD (tr.). *Some Sayings of the Buddha*. Oxford (World's Classics), 1938.

E. J. THOMAS (tr.). *Early Buddhist Scriptures*. London, 1935.

H. C. WARREN (tr.). *Buddhism in Translations*. Cambridge, Mass., 1915.

Mahāyāna Texts

E. B. COWELL and others (tr.). *Buddhist Mahāyāna Sūtras*. SBE xlix, Oxford, 1894.

H. KERN (tr.). *Saddharma-puṇḍarīka*. SBE xxi, Oxford, 1884.

C. BENDALL and W. H. D. ROUSE (tr.). *Śikṣa-samuccaya . . . compiled by Śāntideva, chiefly from earlier Mahāyāna Sūtras*. London, 1922.

D. T. SUZUKI (tr.). *The Lankāvatāra Sūtra*. London, 1932.

(c) *Jaina*

H. JACOBI (tr.). *Jaina Sūtras*. 2 vols., *SBE* xxii, xlv. Oxford, 1884–95.

L. D. BARNETT (tr.). *Antagaḍa Dasāo*. London, 1907.

(d) *Hindu*

For translations of Smṛti Literature, see p. 522.

The Epics

P. C. ROY (tr.). *The Mahābhārata*. 2nd ed., 11 vols., Calcutta, 1919–35.

R. T. H. GRIFFITH (tr.). *The Rāmāyaṇa*. Benares, 1915.

R. C. DUTT (tr.). *The Mahābhārata and Rāmāyaṇa* (abridged versions). London (Everyman), 1917.

SIR E. ARNOLD (tr.). *Indian Idylls*. (Episodes of the *Mahābhārata*). London, 1883.

The Bhagavad Gītā

This has been translated by many hands. Perhaps the best versions for the general reader are those of L. D. Barnett (in Macnicols' *Hindu Scriptures*, London, 1938) and W. D. P. Hill (Oxford, 1928). The scholarly version of F. Edgerton (2 vols., Cambridge, Mass., 1946); includes the original text, interpretation and Sir Edwin Arnold's verse translation entitled *The Song Celestial*.

Later Religious Literature

H. H. WILSON (tr.). *The Viṣṇu Purāṇa*. 5 vols., London, 1864–70.

E. BURNOUF and others (tr.). *Bhāgavata Purāṇa*. 5 vols., Paris, 1840–98.

G. THIBAUT (tr.). *The Vedānta-Sūtras with the Commentary of Śaṅkarācārya*. 2 vols., *SBE* xxxiv, xxxviii, 1890–96.

— *The Vedānta-Sūtras with Rāmānuja's Commentary Śrībhāṣya*. *SBE* xlviii, Oxford, 1904.

F. KINGSBURY and G. E. PHILIPS (tr.). *Hymns of the Tamil Śaivite Saints*. Calcutta, 1921.

J. S. M. HOOPER (tr.). *Hymns of the Ālvārs*. Calcutta, 1929.

J. M. NALLASWĀMĪ PILLAI (tr.). *Śivajñāna Siddhiyār of Aruṇandi*. Madras, 1913.

G. MATTHEWS (tr.). *Sivañāna Bodham of Meykaṇḍa*. Oxford, 1948.

Translations

There are many translations of early Indian literature, but most have been produced in India, and are in the nature of "cribs", with no pretensions to literary merit. We mention a few only of the best literary translations in English.* For translations of religious and legal literature see the bibliographies to chapters iv and vii.

A STUDY OF HISTORY

VOLUME XII
RECONSIDERATIONS

The Royal Institute of International Affairs is an unofficial and non-political body, founded in 1920 to encourage and facilitate the scientific study of international questions. The Institute, as such, is precluded by the terms of its Royal Charter from expressing an opinion on any aspect of international affairs. Any opinions expressed in this publication are not, therefore, those of the Institute.

A STUDY OF HISTORY

BY
ARNOLD J. TOYNBEE

VOLUME XII
RECONSIDERATIONS

He that refuseth instruction despiseth
his own soul, but he that heareth re-
proof getteth understanding.

PREFACE

I AM very grateful for the generous help that I have received towards producing this volume.

The Rockefeller Foundation of New York gave my wife and me a travel grant for the purpose of seeing countries at first hand with an eye to revising the previous volumes of this book. Thanks to this, we have been able to visit a number of Asian and Latin American countries that we had previously known only from books, pictures, and maps. This experience has been an invaluable aid to the writing of this volume.

In July 1958, at Madame Heurgon-Desjardins's invitation, I had the pleasure of taking part in a 'décade', held at Cerisy-la-Salle in Normandy, at which my work was the subject of discussion. I could not have been given a more stimulating start for the writing of the present volume.

My wife has typed the whole of a much-corrected manuscript, and Miss Norah Williams has made a fair copy of this typescript after it had been extensively corrected again. To undertake this hard and exacting work was a great kindness.

My wife has also made the index for this volume, as she did for the previous three sets of volumes. Her indexes are not limited to words and names; they analyse ideas and structure too. They are an integral and indispensable part of the book.

Miss M. V. Stirling has settled queries and filled in blanks in the bibliography. If she had not been so resourceful and indefatigable, the bibliography could not have been completed.

Rabbi J. B. Agus and Professor G. R. Willey have kindly read parts of this volume in typescript and have given me their comments.¹ Their help has been most valuable to me, but it does not involve them in any responsibility for my final version, here printed. The responsibility for this is mine alone.

The Editor of *The Intent of Toynbee's History*, Professor Edward T. Gargan, kindly allowed me to see the typescript of this book before he sent it to the press. This has made it possible for me to make verbatim quotations from it, though not to give the printed page references for these.

I am also indebted to my critics. But for them, this volume would not have been written. My acknowledgements and thanks to them will be found in Chapter II, Annex, Section 1.

ARNOLD TOYNBEE

26 November, 1960

¹ Rabbi Agus's comments are printed in the present volume in full, with his permission, in the annexes to the chapters to which they refer.

<i>B. CRITIQUES OF A. J. TOYNBEE'S WORK</i>	<i>680</i>
 INDEX	 691

INTRODUCTION

IN publishing a book a writer is deliberately exposing his work to 'the wreckful siege of battering days'. This is his own doing. He has been under no compulsion, except an inner one. But, having once published, he must then choose between two alternative policies. He can say, 'What I have written, I have written', and spend the rest of his working life on trying to maintain his previous positions—for no better reason than that he happens once to have occupied them. Alternatively, he can think again; see whether or not he has changed his mind on this or that disputed point; publish the results of these second thoughts; and explain why, after reconsideration, he has in fact changed his mind in some cases and held to his previous opinion in others.

At a meeting of the Royal Geographical Society at which a critique of Ellsworth Huntington's work and mine had been presented by O. H. K. Spate, the Chairman is reported¹ to have remarked, at the close of the discussion: 'I always wish there was some way in the scientific world of retracting what one has said in the past.' Surely there is. *Solvitur ambulando*.

Justice Holmes once wrote that 'to have doubted one's own first principles is the mark of a civilized man'.² In quoting this passage a philosopher, M. R. Cohen, comments that men like Socrates and Einstein 'never outgrow a childlike curiosity about the Universe and continue, as long as they live, to ask questions of the World and to revise mistaken views'.³ The choice between following their example and following Pilate's is not a difficult one to make.

Pilate's stand would indeed be a particularly unreasonable one for me to take about the first ten volumes of this book. One of my critics has called it 'an intellectual autobiography'.⁴ A number of them have pointed out that, in the course of writing it, I have moved from one position to another at least once. If I had not, I should feel uneasy, for that would have meant that my mind had stood still during the thirty-three years (1921-54) that passed between my making of a first sketch for a plan of the book and the publication of volumes vii-x. In this last batch of volumes 'a hardening of the categories' has, indeed, been detected by one critic;⁵ and obviously it is probable that I may show

¹ *The Geographical Journal*, vol. cxviii, Part 4 (December, 1952), p. 428.

³ M. R. Cohen: *The Meaning of Human History*, p. 175.

⁴ R. P. Blackmur in *The Kenyon Review*, Summer, 1955, pp. 357-90.

⁵ 'These last four volumes reveal an aspect of Toynbee which is inevitable in any scholar who has worked at a chosen subject for over a generation. It is what has been called a hardening of the categories. These four volumes are constructed on the framework made familiar in the previous six. . . . All of these concepts were introduced earlier as tentative, hypothetical ideas to be tested out to see how far they could serve in organizing the synoptic historian's material. Now, in the last volumes, they are all taken for granted as having been proved and established—as being, in fact, the framework within which the events of history do actually arrange themselves. What was once a subjective suggestion is now objective fact' (F. H. Underhill in *The Canadian Historical Review*, vol. xxxvi, No. 3 (September, 1955), pp. 222-35).

symptoms of this intellectual malady. But the verdict of other critics makes it also probable that, during those thirty-three years, my mind did move considerably, and, if it did, I am glad of this. That means, however, that, if I now tried to maintain all my previous positions, I should find myself at war with myself as well as with my critics. It is more profitable to try to learn from one's critics than to try to fight them; and the avowal of one's own inconsistencies and changes of view is a small price to pay for the liberty that this gives one to try again and to attempt to do better. One reviewer of the first ten volumes has generously given me credit for changing my views and citing my critics.¹ This testimony is worth having. I shall do my best to continue to deserve it. If there is any treatment that can rejuvenate one's categories, it is the exercise of keeping one's mind open and making a habit of thinking again. Another reviewer has said that this book is my education.² I want to carry this education farther. To stop it would feel, to me, like committing intellectual suicide. So I do not quarrel with this reviewer for going on to say that I have not found my port.³ Another reviewer has called my work a 'quest' (*xetema*).⁴ He feels that my latest position, in the volumes published hitherto, is not a final one,⁵ and he finds a 'tension between the immanent logic of the *xetema* and Toynbee's unwillingness to pursue his search to the end'.⁶ I mean to go on pursuing my search, but I do not expect it to bring me to an 'end', and if I found myself 'in port' I should be distressed. Man's quest is really an attempt to probe to the heart of the mystery of the Universe, and I do not believe that human beings can attain that goal in this life. If a port on this side of death is unattainable, it is best to keep the seas. One does this, of course, at one's peril. 'Es irrt der Mensch, solang er strebt.'⁷

The present volume therefore makes no pretension to finality. It is merely a report of second thoughts. If the English-reading public still tolerated Latin titles, I could not find a better one for this piece of work than Saint Augustine's word *retractationes*. This means 'reconsiderations', not 'retractions', though it is unlikely that a writer will not retract some of his previous propositions if he has reconsidered them genuinely.

The first ten volumes of this book need to be reconsidered now because of the new knowledge and new thought that have been accumulating since the autumn of 1954, when volumes vii-x were published. Some of the new knowledge is new for everybody. During the intervening years there have been important archaeological discoveries and important current events. Some of it is new only for me. I have made good a few of the innumerable gaps in my own knowledge, mainly by travelling round the World and seeing, at first hand, a number of countries that I had previously known only from maps and descriptions.⁸

⁸ See A. J. Toynbee, *East to West* (London 1958, Oxford University Press). I have been able to make this journey, and others, thanks to a grant from the Rockefeller Foundation to my wife and me.

Meanwhile, current events have been following each other thick and fast. A reviewer, commenting in April 1955 on what I have written in volume ix about the prospects of the Western Civilization, remarks that 'perhaps it was written too soon'.¹ This is always true of all attempts at interpreting contemporary history, at whatever date they may have been written. The best that one can do in this field is to go on producing interim reports, and to take care, each time, to put one's provisional findings tentatively. Meanwhile, there has been progress in thought, and some of this, again, has been progress for everybody, while some of it has been peculiar to me. The public progress has been most striking, I should say, in the field of psychology; my private progress has been mainly owing to the critiques of my first ten volumes that have appeared since these were published. I have read, and thought about, as many of these criticisms as I have been able to track down, and have done my best to reconsider with an open mind those things in my work that the critics have questioned, challenged, or disputed. The ideal would be to be able to take one's second look at one's own work as if it were someone else's, and as if one were making one's first acquaintance with it for the purpose of reviewing it. This is the state of mind at which one should aim in order to draw the maximum profit from other people's criticisms. But, since an author is also a human being, it is unlikely that he will succeed in even approaching this degree of detachment.

I have tried especially to take to heart those criticisms in which there has been something like a consensus among critics who differ widely from each other in their temperaments, outlooks, and intellectual equipment. The most important point, I should say, that has been almost unanimously contested has been my claim that my method of inquiry has been an empirical one. Most of my critics evidently have the impression that it has been just the opposite. They feel that I have worked out an *a priori* scheme that is too clear-cut and too rigid to be likely to correspond to reality, and that I have then tried to force the phenomena to fit into this arbitrary framework at the cost of distorting the truth. This is, it seems to me, the most fundamental, and therefore the most serious, of all the criticisms of my work; so I have discussed it as fully and frankly as I have known how to do. I have also reconsidered with special care the other points that have drawn a converging fire; for example, my construction of the course of what I have called 'Hellenic' history to include the history of Rome (a number of critics have objected that the role which I have assigned to Rome is too subordinate a one); my use of this construction of Hellenic history as a pattern or key or 'paradigm' for analysing the histories of other civilizations (this has been cited as an instance of my tendency to force the facts); my construction of the course of what I have called 'Syriac' history, and my consequent handling of Islam and of the Jews.

If it is a good working rule for an author that, where he finds two or more critics agreeing, he should prick up his ears, I must also take notice of an impression that I have evidently made on some critics' minds. This is that I have sought to set myself up as a 'prophet', or,

¹ Neilson, *op. cit.*, p. 57.

short of that, that I have lapsed into playing the prophet unconsciously.

The word 'prophet' has, of course, two distinct meanings, owing to the fact that two different roles have sometimes been played simultaneously by the same person. The ordinary current meaning of the word in present-day English is someone who predicts the future, and on this head I have no need to try to exculpate myself. For one thing, prophecy in this sense is considered to be quite respectable when it is practised by students of the non-human sciences. Astronomers, for instance, prophesy boldly and successfully with impunity. In the second place, I myself believe that prediction is not possible in the field of human affairs. I believe that the outcomes of human choices, purposes, and plans are unpredictable intrinsically, however fully we may be informed about the relevant past facts up to date. And I also believe that these intrinsically unpredictable plans, purposes, and choices play a large enough part in every human situation to invalidate predictions based on other elements in human affairs that might perhaps be predictable if ever they could be isolated. I have set out my views on this explicitly in previous volumes¹ and need not go over the same ground again here. There is, however, also another meaning of the word 'prophet' in which the original Greek preposition 'pro' signifies not 'fore' but 'out'. The prophet in this other sense is not someone who predicts the future; he is someone who speaks out or promulgates the word of God. The prophets of Israel and Judah and the two gentile prophets Zarathustra and Muhammad have been *the* prophets in this sense. It is the official doctrine of Judaism, Christianity, and Islam alike that this series of promulgations of God's will has long since been closed; and, anyway, anybody who set up in the present-day world to be a prophet in this sense would rightly be treated as a figure of fun.² The imputation is difficult to deal with, because the next most ridiculous thing to saying 'I think I am a prophet' would be to say 'I really don't think I am.' Perhaps the best answer is not a verbal but a practical one. A readiness to believe that one may have been mistaken in the views that one has expressed is surely incompatible with believing that they are not one's own, but God's. So I hope this volume of reconsiderations may effectively dissipate the spectre of 'Toynbee the prophet'.³

¹ For instance, in i. 299-302, and in ix. 167-405.

² I admire Dean Inge, nevertheless, for having had the courage to write: 'The philosopher ought to be a prophet' ('The Place of Myth in Philosophy' in *Philosophy*, vol. xi, No. 42 (April, 1936), pp. 131-45, ad fin.).

³ Pieter Geyl, at any rate, seems to hold that playing the prophet and paying attention to criticisms are incompatible. In a critique in which he says that my work is vitiated by my thinking that I have a 'message' (M. F. Ashley Montague: *Toynbee and History*, p. 360), and that I am not an historian but a prophet (*ibid.*, p. 370), he complains that I do not reply to my critics and that I never will reply, because I am impervious to criticism (*ibid.*, pp. 375-6). I take this argument of Geyl's to hold good in reverse: in this volume I have replied to my critics; therefore I cannot be a prophet after all. Geyl is not implacable. In another critique, published in the same volume (p. 68), he says that my 'method, at any rate, is not intended to be that of the religious prophet'. He also lets me off rather lightly when he says (in *Toynbee and History*, pp. 372 and 377) that, if I labelled myself 'prophet' instead of 'historian', he would have no quarrel with me. Indeed, he goes so far as to say that, 'as a prophet, as a poet, Toynbee is remarkable' (P. Geyl, *Debates with Historians*, p. 143).

At the same time I am now uncomfortably aware that, without my having been conscious of this, there must have been things in the previous volumes of this book that raised this spectre in the minds of several critics.¹ One such thing may have been my declared belief that a study of human history up to date reveals a certain number of recurrent patterns. 'All cyclical theorists', H. Stuart Hughes says,² 'play the role of intuitive seers.' I need not repeat that I am not a determinist. I do not believe that any of these past recurrences were inevitable, nor do I believe that any of them, or any others, are bound to repeat themselves in the future. But my belief that I have descried recurrences in the past may have given me the air of being a 'seer', if Hughes is right. Another possible source of this impression is my belief—mentioned already in this chapter—that Man's quest cannot stop short of trying to probe the heart of the mystery of the Universe. But, if following this quest is tantamount to setting up as a prophet, then this offence is committed by every human being who passes through this life; for following Man's quest is, I believe, an inescapable part of being human.

A third possible source of the impression has been mentioned by Hourani.³ In volumes vii-x of *A Study of History* Hourani is conscious of 'a strange, exalted, excited note, more fitting to prophecy than to science'; and Sir Ernest Barker⁴ uses almost identical words. I write, he says, 'on a high and strained note'. Geyl too finds me 'high-strung'.⁵ I am conscious of this myself, and I think the explanation is not far to seek. It has, indeed, been detected by more than one of my critics. These four volumes were written after the atom bombs had been dropped on Nagasaki and Hiroshima. The note heard in volumes vii to x was already audible in volumes v and vi, which were written between the Italian invasion of Abyssinia and the outbreak of the Second World War. In reviews of volumes iv-vi Sir Maurice Powicke noted that my mind struck him as being not a 'cool' one,⁶ and Sir Llewellyn

¹ Besides Pieter Geyl, who has been cited in the previous footnote, W. den Boer (in *Toynbee and History*, p. 238) and Albert Hourani (in loc. cit., pp. 399-400) record the same impression. F. H. Underhill finds that I escape from being caught in Spengler's determinism 'by soaring above history to become a metahistorian, a prophet, a theologian', and that it is my 'system-making, with its prophetic overtones of doom to come', that makes me 'attractive to the general public of the last ten or fifteen years' (*The Canadian Historical Review*, vol. xxxii, No. 3 (September, 1951), pp. 201-19. Underhill gives me to same label *ibid.*, vol. xxxvi, No. 3 (September, 1955), pp. 222-35). H. Trevor-Roper seems to think that I set myself up as a prophet in both senses of the word (*Toynbee and History*, p. 122). J. F. Leddy thinks that I oscillate between behaving like a prophet and claiming to be an empirical historian (*The Phoenix*, vol. 11 (Toronto 1957, University of Toronto Press), pp. 140-1). Father L. Walker, O.P., feels that I have not 'been content with being just a historian but have tried also to be a prophet and teacher' (*Toynbee and History*, p. 146). E. E. Y. Hales says: 'In reality he is a religious prophet, who uses his wide knowledge of history to exemplify and reinforce his religious teaching' (*History Today*, May, 1955, p. 322). This is L. C. Stecchini's impression too. 'Toynbee', he says, 'has gone so far as to try to reclaim for the historian the right to prophesy' (*Midstream*, Autumn, 1956, pp. 84-91). On the other hand, Crane Brinton finds that this book 'is not a prophetic work in the specific sense that word has in the Judaeo-Christian tradition' (*The Virginia Quarterly Review*, vol. 32, No. 3 (Summer, 1956), pp. 361-75). T. S. Gregory reports that, 'more or less deliberately, Mr. Toynbee refuses to be "the prophet of the World's final causes"' (*The Dublin Review*, vol. 220, No. 440 (Spring, 1947), pp. 74-87). A. L. Guerard pronounces that 'Spengler is a prophet; Toynbee is an inquirer' (*The Herald-Tribune*, 28th October, 1934).

⁴ In *Toynbee and History*, p. 93.

⁵ *Ibid.*, p. 373.

⁶ *The Manchester Guardian*, 29th September, 1939.

Woodward that 'deep and genuine' emotions were manifest in my work.¹ Woodward pointed out, in the same context, that these volumes had been 'written, like the *De Civitate Dei*, under the strain of immediate social catastrophe'. Kohn has noticed² that the difference in outlook between volumes vii-x and volumes i-vi is a reflection of the course of public events between 1939 and 1954. Hofer makes the same point in general terms. He points out that the questions put to history by me, like those put by Alfred Weber, are no longer of the same kind as Ranke's questions. 'In their study of history (*Geschichtsbetrachtung*) they are consciously seeking to be serviceable to the needs of the time in which we are living by being of some help to it in its grave spiritual and political crisis (*Lebensnot*). One might put it that their recognition of the urgency of this crisis was the stimulus by which their questions were originally evoked.'³ Anderle observes⁴ that, in Tange Lean's account of my work,⁵ 'the prophetic note is not taken as being an aberration, as it is by Geyl, Barnes, and others. Lean presents Toynbee as the exponent of a given cultural situation, the embodiment of the anxiety of the age over the existential issue (*Verkörperung der Existentialangst der Epoche*), its obsession with the spectacle of decadence in the face of death, and its burning desire in some way or other to transcend transitoriness and to make sure of achieving immortality.'

The consequent note of urgency and anxiety may be unscientific, but I do not find it at all 'strange' in the circumstances. On the contrary, I think it would have been strange if I had not felt deeply enough about these tragic and ominous public events for my feeling to come out in what I was writing at the time. To be sensitive to what is going on in the World is, I should say, a mark just of being human. It ought not to put one under suspicion of setting up to be a prophet, but it may perhaps have contributed, all the same, to the creation of this impression about me. Anyway, all but, possibly, one of those critics who have indicted me for the offence of setting up as a prophet have, I am sure, made the charge in good faith. If anyone is at fault, it is I, for having unwittingly given them cause for misunderstanding me.⁶

The educational value of any critique depends on its spirit and its method. A few critics write with an animosity which suggests that their first concern is to draw blood from the colleague whose book they are reviewing. This spirit surely militates against the purpose for which books are given out for review. This purpose is the correction of error and the increase of knowledge and understanding. It is an impersonal purpose and one that the reviewer shares with the writer whose work he

¹ *The Spectator*, 18th August, 1939.

² H. Kohn in *Der Monat*, Berlin, August, 1955.

³ W. Hofer: *Geschichte zwischen Philosophie und Politik*, p. 129. Lewis Mumford, too, sees in *A Study of History* a piece of action—but, as he sees it, it is action that leads, like Reinhold Niebuhr's, to an 'other world' (*Toynbee and History*, p. 143).

⁴ In an unpublished paper.

⁵ In *Toynbee and History*, pp. 12-38, especially pp. 35 seqq.

⁶ In reviewing vols. iv-vi of this book Sir Llewellyn Woodward remarked: 'It is, of course, impossible for a historian to insulate himself from the present, but at least he ought to be on his guard against putting himself in deliberate and unnecessary contact with lines of thought highly charged with emotion' (*The Spectator*, 18th August, 1939). There is justice in this counsel, and I recognize that it is good advice for me.

is appraising. To serve this purpose effectively, a review must, of course, be severe if severity is called for in the reviewer's judgement. I have profited particularly from reviews that have been severe without being hostile. The value of a review also depends on the reviewer's way of working. Some critics work with the road-metal-worker's hammer. Sometimes it is the stone that breaks, sometimes, perhaps, the hammer-head. In either case the result is on the small scale, and its value, while appreciable, is limited. A more creative kind of criticism is the kind that blows in like a sand-laden wind from the desert; for this usefully transforms the landscape. It finds out the softer rocks and scours them away, and it grinds down the harder rocks' sharp edges. Anything that still stands after this wind has done its testing work will be that much nearer to reality.¹

Books are expendable, like the man-hours that go to the making of them. A book that has been weathered away will have served its purpose if it provokes other minds to write other books that may perhaps prove less vulnerable. The one thing that matters is that inquiry shall go on; for, so long as it continues, there is hope that it may also get further.

I am, of course, a reviewer myself, besides being an author. Almost every writer is constantly alternating between the two roles. When I am playing the role of a reviewer I find it a useful rule to remind myself of the indubitable truth that a reviewer inevitably reviews himself, too, in the act of reviewing the author whose book lies on his dissecting table. Whenever a reviewer is tempted to treat an author as a dart-board he should remember that the missile which his hand is itching to lance is not a dart but a boomerang. Reviewing, as well as writing, is, in fact, a dangerous trade. But a reviewer can reduce the danger to which he is exposing himself. He can avail himself of safeguards that are at the same time virtues worth cultivating for their own sakes. These tutelary virtues are humility and generosity. The point has been put by H. J. Morgenthau in a critique of my work.²

'We can judge what others have tried to do and have done only if we ourselves have tried to do, or at least have dreamt of doing, what they have done.'

¹ I owe this simile to J. F. Leddy. The article, cited in footnote 1 on p. 5, ends as follows: 'His work might well remind us of one of those colourful outcroppings of rock to be seen sometimes in flat country, once much larger but still raising a sharp silhouette against the sky. As time has passed, the winds have eroded the softer layers of rock, crumbling them away, and so projecting the more durable veins of granite into greater prominence. Such may be the . . . fate awaiting Toynbee's . . . study when once the winds of criticism have worn away those lines of thought which do not deserve to remain, . . . and so have left in plainer view the . . . outlines of his reduced but still massive structure.'

² In *Toynbee and History*, p. 191.

PHILOSOPHICAL CONSIDERATIONS

I. THE INADEQUACY OF OUR MEANS OF
THOUGHT

I. APPREHENSION THROUGH ANALYSIS AND CLASSIFICATION

A PHILOSOPHER will probably find little in this chapter except truisms and elementary errors, if he finds anything at all that is not a meaningless misuse of words. All the same, at my peril, I have to write it, because some of my critics have been philosophers who have taken issue with me on philosophical grounds. I exposed myself to this by raising philosophical questions. I did not seek these out. I found them arising out of a study of history. This is, I should say, to be expected, because, as I see it, the study of human affairs is really one and indivisible. The conventional academic dismemberment of the vast subject into 'disciplines' is a convenient, and perhaps unavoidable, educational device, but it is an arbitrary surgical operation, and this makes it a serious impediment to the gaining of knowledge and understanding.¹ It is true that any one mind can make itself thoroughly familiar with no more than some patch of the great forest. Yet, unless it also dares to venture out into the surrounding stretches that, for it, happen to be *terra incognita*, it cannot hope to understand the nature even of its own narrow beat.

All study, whether of human affairs or of non-human nature, is subject to the limitations of human thought; and the first and greatest of these is that thought cannot help doing violence to Reality in the act of trying to apprehend it.

For all that we know, Reality is the undifferentiated unity of the mystical experience. We cannot know whether it is or is not, because we cannot know anything without being in a state of consciousness, and we cannot be conscious without our mental image of Reality—or Reality's image of itself, mirrored in a human mind²—being diffracted or articulated into subject and object.³ This is the first link in a chain of articulations that we forge as fast as we go on thinking.

Our human consciousness, after its self-generating—or Reality's

¹ See further pp. 128–32.

² 'The consciousness of each of us is evolution looking at itself and reflecting' (Father Pierre Teilhard de Chardin, S.J.: *The Phenomenon of Man* (London 1959, Collins), p. 221).

³ 'Almost incurably subject and object tend to become separated from each other in the act of knowing. We are continually inclined to isolate ourselves from the things and events which surround us, as though we were looking at them from outside, from the shelter of an observatory into which they were unable to enter, as though we were spectators, not elements, in what goes on' (Father Pierre Teilhard de Chardin, S.J., *op. cit.*, p. 220).

generating—articulative act, goes on to dissect Reality farther into the conscious and the subconscious, soul and body, mind and matter, life and environment, freedom and necessity, creator and creatures, god and devil, good and bad, right and wrong, love and power, old and new, cause and effect, and so on. Such dichotomies are indispensable categories of thought; they are our means of apprehending Reality, as far as this is within our power. At the same time they are so many boundary-marks indicating the limits of human understanding, since they misrepresent Reality by breaking up its unity in our apprehension of it. They are as baffling as they are enlightening. We cannot do without them, yet cannot do with them either. We cannot afford either to discount them completely or to take them at their full face value.¹

We cannot think about the Universe without assuming that it is articulated; and, at the same time, we cannot defend the articulations

¹ It is, no doubt, difficult to use categories as instruments for trying to grasp Reality without falling into the error of treating them as if they were absolute realities in themselves. I have evidently fallen into this error myself. At least five critics have censured me for succumbing to dualism: Lewis Mumford (in *Diogenes*, No. 13 (Spring, 1956), pp. 22–23, and in *Toynbee and History*, p. 145); J. K. Feibleman (in *T'ien Hsia Monthly*, vol. xi, Nos. 1 and 2 (1940), pp. 13–14); Albert Hourani (in *The Dublin Review*, vol. 229, No. 470, p. 377); W. Altree (in *Toynbee and History*, p. 270); and Father L. Walker, O.P. (in *Toynbee and History*, p. 344). In Mumford's eyes this dualism has involved me in 'profound Augustinian pessimism' (*Diogenes*, loc. cit., p. 11) and in an unresolved contradiction between this mood and an incompatible 'thisworldliness' (*ibid.*, p. 21). Feibleman, in the passage cited above, writes that Toynbee 'sets up primary categories which immediately involve him in an ontological dualism, an epistemological subjective idealism, and a theological transcendentalism. The first is precarious and tentative, the second partial and tenuous, and the third total and absolute; all three are nominalistic.' In particular, he objects to my dichotomy between 'spirit' and 'matter', and adds, with justification, that I ought to have defined my use of these terms, but have failed to do this. Altree, too, objects to this dichotomy. Walker objects to my dichotomies between reason and the subconscious and between truths of science and truths of religion. Mumford finds that I have dug a gulf between the world of Nature and the world of Spirit. This gulf, he insists, must be closed (*Diogenes*, loc. cit., p. 24); I ought to rise to a holistic standpoint (*Toynbee and History*, p. 146). Feibleman deplores my 'old-fashioned kind of ascetic transcendentalism' (loc. cit., pp. 147 and 152) and urges me (*ibid.*, p. 142) to embrace the doctrine of immanence, which, as he points out on p. 157, I have, in fact, adopted in one passage (*A Study of History*, vol. iv, p. 647). Richard Pares feels that I have gone too far in dissecting the mind into different layers (*The English Historical Review*, vol. lxxi, No. 279 (April, 1956), p. 258).

These charges of dualism might seem, at first sight, to be cancelled out by charges that, in my conception of history, 'the Deity becomes almost entirely immanent and loses all transcendent qualities' (C. B. Joynt in *The Australasian Journal of Philosophy*, vol. 34, No. 3 (December, 1956), p. 201); that 'Toynbee either fails to make necessary distinctions or blurs them' (M. A. Fitzsimons, in *The Intent of Toynbee's History: A Cooperative Appraisal*; that I have 'a passion for unity' (Fitzsimons in the same context, and Sir Ernest Barker in *Toynbee and History*, pp. 94–95); and that I have an impulse to push the process of synthesis and schematization farther than is warranted by the phenomena (e.g. Sir Ernest Barker in *Toynbee and History*, p. 95; K. D. Erdmann in *Archiv für Kulturgeschichte*, xxxiii. Band, Heft 2 (1951), pp. 242–3; R. L. Shinn in *Christianity and the Problem of History*, p. 227; H. A. L. Fisher in *The Nineteenth Century and After*, December, 1934, p. 671; J. Vogt in *Saeculum*, No. 2 (1951), pp. 557–74; G. Weil in *Toynbee and History*, p. 285; A. Hourani in *The Dublin Review*, vol. 229, No. 470 (December, 1955), p. 381; J. K. Feibleman in *T'ien Hsia Monthly*, vol. xi, Nos. 1 and 2 (1940), p. 23).

Though these two errors (if such they are) are in contrary directions, I think I have, in fact, probably fallen into both of them. But I also think that, if I have, this illogical commission of two contradictory offences is not peculiar to me, but is a weakness that is a consequence of the nature of thought. A human mind seeks unity, but cannot approach it without paving its path with dichotomies. 'Segmentation is humanly inevitable, i.e. essential to sane observation'; 'the problem of causation is . . . merely one aspect of the wider problem of individuation' (M. R. Cohen: *The Meaning of Human History*, pp. 107 and 108).

that we find, or make, in it against the charge that these are artificial and arbitrary, that they do not correspond to anything in the structure of Reality, or that, even if they do, they are irrelevant to the particular mental purpose for which we have resorted to them. It can always be shown that they break up something that is indivisible and let slip something that is essential. Yet, without mentally articulating the Universe, we ourselves cannot be articulate—cannot, that is, either think or will. And we cannot go on thinking or willing if we regain the unity of the mystical experience. So we have to dissect—and, in dissecting, misrepresent—Reality in order to be able to apprehend Reality sufficiently to be able to act and live in the light of the truth as far as we can discern it. Our inability to apprehend Reality completely is, of course, not surprising. It is a paradox that one part of a whole should be able to distinguish itself from the rest and should then be able to achieve even a partial apprehension of the whole, including itself. This feat is miraculous, however imperfect. How far it does fall short of attaining a true mental image of Reality it is impossible for a human mind to tell. 'We have a kind of knowledge, but it is of a kind which can be corrected or perfected.'¹

Thought has no sooner set itself going by mentally breaking Reality up than it gets to work to put Reality together again. After having analysed, thought operates by classifying: that is, by identifying a number of different objects as being specimens of one and the same kind.² These objects between which the mind finds sufficient resemblance to allow it to bring them mentally under some single head are no more than particular facets of phenomena.³ The facets of any phenomenon are innumerable, as is demonstrated by our ability to classify one and the same phenomenon in innumerable different ways, each corresponding to some different facet that it displays.⁴ So any one classification apprehends no more than a fraction of each of the phenomena that it brings together; and, when we have classified the same phenomenon under as many different heads as it displays facets whose like we can detect in other phenomena, we are still left with an unidentifiable residue.⁵ This residue is of unknown magnitude.

The human mind's mental categories are thus 'incomplete tools'.⁶ 'No conscious experience can grasp any object, not even ourselves, in all its completeness. . . . There is no knowledge, no matter how abstract, which does not point to some *it*.'⁷ This 'it' is not something positive that we can apprehend as being a phenomenon's 'essence'. It is the

¹ Father M. C. D'Arcy, S.J.: *The Sense of History*, p. 46. Cp. pp. 138–9.

² 'All mental phenomena—sense perceptions and images as well as the more abstract "concepts" and "ideas"—must be regarded as acts of classification' (F. A. Hayek: *The Counter-Revolution of Science*, p. 47).

³ 'All thought must be to some extent abstract. . . . All perception of Reality, including the simplest sensations, involves a classification of the object according to some property or properties' (*ibid.*, p. 68).

⁴ See *ibid.*, pp. 68–69 and 70.

⁵ 'The human mind can never grasp a "whole" in the sense of all the different aspects of a real situation' (*ibid.*, p. 70). On the other hand, C. B. Joynt contends, in a letter of 14th August, 1959, that 'any object has a certain unity or wholeness which characterises it'.

⁶ R. L. Shinn: *Christianity and the Problem of History*, p. 19.

⁷ M. R. Cohen: *The Meaning of Human History*, p. 42.

residue of a phenomenon that has eluded all classification. This is what we mean when we say that in every phenomenon there is something 'unique'. This word 'unique' is a negative term signifying what is mentally inapprehensible. The absolutely unique is, by definition, indescribable.¹ In fact, the unique element in a phenomenon is like the intractable core of a Palaeolithic flint-knapper's nugget, which defies his skill after he has struck off flake after flake and blade after blade. These flakes and blades fly off in familiar standard shapes. The residual core's shape is all its own; no other core's shape is identical with it.

Why does a human mind employ a method of operation which is bound, by its very nature, to yield incomplete and imperfect results? Perhaps the answer is to be found in our minds' nature, which is finite, and in their purposes, which are primarily practical. Though the human brain is so superbly built and so cleverly packed into its case that it can register the maximum number of permutations and combinations of mental associations that is possible for an instrument of its volume, this number, though very great, must be finite, whereas the number of phenomena with which a mind has to deal is infinite. It is only by classifying this infinite host of phenomena under heads that the mind can attempt to cope with them. The price of classification is, no doubt, some degree of misrepresentation. But the alternative to the payment of this price would be intellectual paralysis; and, for most minds' usual purposes, the price is not inordinately high because the misrepresentation is not frustrating. It may be frustrating and even exasperating to minds, like my critics' and mine, that want knowledge for its own sake, are insatiable in seeking it, and cannot rest content while any residue of reality remains unknown to them. Such restless minds, however, are a small and almost freakish minority. Most minds do not want knowledge for its own sake; they want the minimum doses of knowledge that are sufficient for guidance in taking action in particular circumstances. Knowledge beyond that quantum is a matter of indifference to them. Indeed, besides being superfluous, it would be a positive impediment to them owing to its irrelevance.

'In theory we could describe every site on the Earth's surface as a unique thing-in-itself, as in strict logic it is. But, even if this were practically feasible, it would take us nowhere: the mere bulk of facts could not be grasped by the human mind; we must classify, and that implies evaluation.'²

'All description is necessarily selective.'³

Suppose that a human mind were to set itself to grasp every

¹ Cohen, *op. cit.*, p. 84. Philip Bagby points out in *Culture and History*, pp. 33-34, that this is demonstrated by the inability of historians ever to describe a unique event exhaustively. The logic of the mind's method of operation is put by Bagby, *ibid.*, p. 58, as follows: 'Absolute difference would eliminate all possibility of comparison. Absolute similarity would reduce all difference to identity and leave us nothing to compare.' The same point is made by R. Redfield in *The Primitive World and its Transformations*, p. 100. 'Absolute chaos is inconceivable. The notion of regularity, of what is called law, is inescapable. Yet it is probably also true that every world view combines with the idea of law or regularity the idea of capriciousness.' See also the present volume, p. 73.

² O. K. H. Spate in *Geographical Studies*, vol. iv, No. 1 (1957), p. 2.

³ K. R. Popper: *The Poverty of Historicism*, p. 77.

phenomenon exactly in its unique entirety, without misrepresenting it by introducing any reference to, or mental association with, any other phenomena. It would be burdening its powers of memory with a Psyche's task—as if someone were to set himself to memorize the visual shapes of all the myriads of Chinese characters without deigning to make use of the radicals under which the characters have been rather artificially and arbitrarily grouped. And then, supposing that this illimitable and therefore impossible feat of memorization had been accomplished, of what practical use would it be? The normal purpose of trying to apprehend a phenomenon is not just to know it; it is to deal with it. And how can one deal with a phenomenon that one has come to know so perfectly that one has inhibited oneself from referring it to, or associating it with, any other phenomenon? A knowledge that was as theoretically complete as this would be equivalent to complete ignorance for practical purposes.

It seems as if one might almost say that the mind is an effective instrument for its usual purposes just because it is an imperfect one. Then how is a scholar to use this instrument for his peculiar purpose of study for study's sake? The obvious line for him to follow first is the line of least resistance; and the line of least resistance is to keep in step with the innate operational movement of the mind as far as the inquirer finds that this line will carry him. This is the policy that has been followed, with cumulative success, by students of non-human nature. Physical scientists 'are concerned . . . with formulating general propositions about the patterned interrelationships of . . . events', and 'science is the study of observed regularities'.¹ Have we any warrant for not following the same intellectual procedure when human nature is the object of our study? If it is contended that the drawing of an analogy between the processes of human history and those of non-human nature is inadmissible² or, short of that, hazardous,³ and that I, in particular, have applied to thought about human history a method appropriate to thought about non-human nature,⁴ it may be admitted that 'the simple repeatable patterns of physics or physical laws have not been discovered in human affairs',⁵ but, nevertheless, it must be pointed out that a human being possesses only one mind, and that this mind operates in only one way—that is, the analytical and classificatory way—whatever kind of phenomenon its owner may set it to work on. The onus of proof lies on those who deny the reality of the uniformity that is found in Reality by the analysing and classifying human mind.⁶ If the analytical and classificatory method that works well when we are studying non-human nature is to be ruled out when it is a question of studying human

¹ P. Bagby: *Culture and History*, pp. 4-5 and 84. He goes on to point out that 'comparative study' involves showing not only similarities but also consistent differences. These differences also constitute a kind of regularity (*ibid.*, p. 183).

⁴ A. Hourani in *The Dublin Review*, vol. 229, No. 470 (December, 1955), p. 382. This is the charge that I myself have brought against the modern Western historians at the very beginning of this book.

⁵ M. R. Cohen: *The Meaning of Human History*, p. 116.

⁶ R. Caillois in *Diogenes*, No. 13 (Spring, 1956), pp. 2-3.

nature, we are left without any method for proceeding. Surely it is common sense to make a start in the study of human affairs by continuing to follow the mind's innate method, and to find out, by exploration, how far this method will carry one in this field. If and when we find ourselves brought to a standstill, with still unconquered ground ahead of us, we shall then be in the best possible position for examining whether any change of method is practicable, and, if it is, what our new method should be.

This is the policy that I myself have followed in the first ten volumes of this book. In Part XII I have tried to find the locus of a frontier dividing the realm of human affairs between a province of necessity and a province of freedom,¹ after having concentrated, in the preceding parts, on making as exhaustive an inquiry as I could into the regularities, uniformities, and recurrences that human affairs display. In the earlier of these two successive sections of the book I have deliberately pushed my exploration of regularities in human affairs to the limit; and, since, by temperament, I am, I believe, intellectually rash, I am willing to take it from my critics that I have not only reached the limit but have passed it. In a benevolent review of the first three volumes of the book, H. A. L. Fisher says that 'the generalisations are sometimes overdriven'.² Lewis Mumford says³ that I do not make enough allowance for what is non-repetitive and unique. K. D. Erdmann finds⁴ that, in my petrified schematization, I have come near to losing sight of the individuality of events.

2. THE HISTORIANS' PURSUIT OF THE UNIQUE

These excesses of mine—if I am guilty of excesses—evidently deserve the notice, and the reproof, that they have received. But my plan of work has not only drawn reasoned criticisms of the way in which I have carried it out; it has also provoked strong, and even violent, hostility among a considerable number of my fellow historians. It has been noted⁵ that in the United States I was ill received by extremely distinguished reviewers—e.g. Charles A. Beard and Lynn Thorndike—in the important professional journals. This reaction has not been peculiar to American scholars; I am conscious of an even stronger current of hostile feeling among British and Dutch scholars, and also of a more aloof distaste and disapproval among French scholars. This vein of emotion has surprised and puzzled me. At first sight it seems uncalled for in an intellectual argument; for in this field emotion is not only irrelevant but is notoriously inimical to clear thinking. On consideration I have come to the conclusion that—when full allowance has been made for the annoyance that my way of working evidently gives to scholars with a different temperament—the personal hostility that I have unintentionally drawn on myself is only a minor cause of the hostile

emotion that the publication of my work has evoked. If the distinguished scholars who have hurled thunderbolts at me had merely felt annoyed with me personally, they would have just ignored me, which would have been a more effective way of trying to dispose of me than the policy of anathematizing me which they have actually adopted. I believe that the strength of their feeling reveals that they felt themselves to be fighting about something much more important than anything merely personal. They are, I think, up in arms in defence of the uniqueness of historical events and human personalities. This is, in their eyes, a treasure of supreme value; and my work has been a red rag to them because they have taken it as a symbol of an attack on the principle of respect for the element of uniqueness in history which they value so highly.¹ As a matter of fact I, too, value it; but at the same time I am conscious that, besides the element of uniqueness in human affairs, there is also an element of uniformity, and that, of the two, this is by far the less difficult for human minds to apprehend. This is, I think, why I have been misread as if I were denying the unquestionable truth that an element of uniqueness is to be found in human affairs.

A high valuation of this element of uniqueness within the realm of human nature is evidently what has made its status a burning question in the study of human affairs, while it is not one in the natural sciences. This also perhaps explains why it is that, among the various schools of students of human affairs—philosophers, theologians, logicians, psychologists, anthropologists, sociologists, historians—it is the historians who have made it their business to be not only the exponents of the element of uniqueness, but also its champions. The most obvious definition of an historian is to see in him a student of human affairs as these present themselves in motion through time; but a different definition has been proposed by A. L. Kroeber. The essence of the historian's approach, Kroeber suggests, is not the vision of human affairs as temporal events; it is 'the endeavour to achieve a conceptual integration of phenomena while preserving the integrity of the phenomena'.²

'The attachment to contiguity in space and time, to continuity of the spatial and temporal relations of the phenomena, coupled with attachment to the phenomena themselves, is what gives the historical aspects of phenomena their semblance of immediate reality. It is also the factor which prevents the historical approach as such from attaining to "laws", to general theory, to exactness of measurable findings, and to genuine verifiability by experiment. It is also what gives historical findings their quality of uniqueness, their individuation, their physiognomic property.'³

¹ W. H. McNeill notes, in *The Intent of Toynbee's History: A Cooperative Appraisal*, that I have 'the habit of mind which strives in the face of all the diversity of experience and of history to arrive at the interconnectedness of things—to see multiplicity and discrepancy reduced to unity and order, to see the whole in the parts, the One in the Many. This is, indeed, the most basic and fundamental quality of Toynbee's mind, a quality perhaps unusual in an historian, who is normally liable to be arrested and intrigued by the variety and multiplicity of things and take the data of history more or less for what they are—infinately various, changeable, shifting, and interesting.' The Rev. E. R. Hardy Jr. finds, *ibid.*, that 'the composition' of this book 'is remarkably unified'. He generously adds that my 'central themes are really central'.

² A. L. Kroeber: *The Nature of Culture*, p. 70. Cp. pp. 63, 102, 127.

³ Kroeber, *op. cit.*, p. 101.

'All recorded history [is] a series of objective unique events whose significance lies in their organisation into distinctive patterns and not in ill-defined formulas or generalised denominators.'¹

The same characteristic of history is singled out by F. A. Hayek and by Alan Bullock as being distinctive of it.

'In the social field [as contrasted with the fields of most of the natural sciences] a particular or unique event is often of such general interest, and at the same time so complex and so difficult to see in all its important aspects, that its explanation and discussion constitute a major task requiring the whole energy of a specialist.'²

'What the historian finds fascinating is to come as close as he can to the concrete and the individual, to try to get inside the skin of *the* man or group of men, . . . to trace the causes, the connections and consequences of this particular revolution . . . or a particular series of events. . . . History is always an attempt to explain the sequence and connection of events.'³

Bullock is careful not to overstate his point.

'The moment the historian begins to explain, he is bound to make use of general propositions of all kinds. . . . The historian gives a false account of his activity if he tries to deny the part that general ideas and assumptions play in his work. There is, however, a difference between the historian on the one hand and the metahistorian, seeking for patterns of historical evolution, or the sociologist, seeking for general laws, governing human development, on the other. This difference lies in their purpose and in the use that they make of such generalizations. What the metahistorian and the sociologist are trying to do is to clear away the confusion of facts and reveal the pattern, or establish the law, which lies beneath. But this is not the historian's purpose; what he wants to know is what happened. For him, general propositions are both necessary and illuminating, but they are not the essential purpose of his work.'

Joynt and Rescher make a point that bears out Bullock's thesis. 'Historians', they point out,⁴ 'tend to formulate, not general laws, but restricted generalizations, limited by spatio-temporal considerations, but fully valid and law-like within them.' Conversely, a sociologist, Michael Postan, commends me, in a review that is otherwise mostly critical, for pursuing historical information, not for its own sake, but for the purpose of using it as scientific evidence.⁵

The historians' approach to the study of human affairs, which Postan here deprecates, has merits to which Kroeber draws attention. Science, in pursuing its method of abstraction, resolves phenomena into 'metaphenomenal' formulas.⁶ But the higher the level of the phenomena under consideration, the more recalcitrant they are to this scientific treatment

⁵ M. Postan in *The Sociological Review*, vol. xxviii (1936), p. 53 (see further pp. 225-7). K. D. Erdmann, on the other hand, is critical of my treatment of history as a series of examples (*Archiv für Kulturgeschichte*, xxxiii. Band, Heft 2 (1951), p. 203).

⁶ Kroeber, *The Nature of Culture*, p. 101.

that is designed to discover uniformities and repetitive regularities as a basis for prediction. On the other hand, phenomena of the higher kind yield readily to historical treatment.¹ My own approach to history is criticized by H. Frankfort² on the ground that

'his use of "species" and "genus" obscures the fundamental fact that science can study individuals as members of a species only by ignoring their individual characteristics. The historian, following this course, would defeat the very purpose of his work. In fact, Toynbee's vaunted empiricism is an attempt to transpose the method of the natural sciences, where experiment is essential and experience is reduced to figures, to history, where experiment is impossible and experience subjective.'

The historical outlook (*Historismus*) involves

'the recognition that a consideration of history that is obtained by factual research does not enable one to extract from it any consistently intelligible picture of universal history. So far from throwing light on concrete situations and events, interpretations of the general course of history that are based on theological or rationalist dogmas actually themselves require to be interpreted historically. In reaching this conclusion, the historical outlook has won for itself a standpoint of its own which is distinct not only from that of physical science but also from that of metaphysical and natural law.'³

'In recognizing the uniqueness of its subject matter and in failing to reduce it to instances of a law, the procedure of history differs from that of science.'⁴

Historians

'are convinced that the differences between civilizations are more significant than their likenesses, and that standardised causal patterns cannot logically be deduced from the facts of history'.⁵

This point has been driven home by Christopher Dawson:

'It is [the] mysterious and unpredictable aspect of history which is the great stumbling-block to the rationalist. He is always looking for neat systems of laws and causal sequences from which history can be automatically deduced. But history is impatient of all such artificial constructions. It is at once aristocratic and revolutionary. It allows the whole world situation to be suddenly transformed by the action of a single individual like Mohammad or Alexander.'⁶

⁴ M. C. Swabey: *The Judgment of History*, p. 113.

⁵ L. Stone in *Toynbee and History*, p. 111.

⁶ Chr. Dawson: *The Dynamics of World History*, ed. by J. J. Mallory, p. 257. Ibid., p. 90, Dawson writes: 'There is an unknown quantity in religious change which defies the most careful historic analysis'; and in illustration of his thesis in its application to religion he cites, here too, the epiphany of Islam and also the conversion of the Roman Empire to Christianity.

I myself believe that, in human affairs, something that we may well call 'creativity', in default of a more revealing word, is perpetually at work, and that this is constantly producing novelties that have not only not been predicted but have been intrinsically unpre-

These are impressive justifications for the historian's approach. At the same time this approach is open to challenge on two grounds. Its critics may contest the value of the element of uniqueness in human affairs, which historians prize so highly. And they may contend that, whatever its value may be deemed to be, the unique is not apprehensible by human minds.

The value of phenomenal human selves and of their experiences in the media of time and space has been rated low in Indian thought since at least as early as the sixth century B.C. This low valuation was common ground between the Buddha and the contemporary school of Indian philosophy with which he took issue. Both schools put their treasure in Absolute Reality. The school that the Buddha was opposing conferred value on phenomenal human selves by identifying them with Absolute Reality and giving them the good tidings that they could experience this truth for themselves by an act of intuition. The Buddha took the more radical line of analysing phenomenal human selves into discontinuous series of successive psychological states kindled by desire and kept alight

dictable. Thus I agree with Dawson in the point that he is making in the two passages here quoted. At the same time, I do not think that the cases which he has cited here really illustrate his thesis. I do not believe that either of the revolutions headed respectively by Muhammad and by Alexander can properly be described as 'the action of a single individual'. Surely both were the result of the interaction between a leader and his followers in a particular set of circumstances. Without the circumstances and the followers, the leader would not have found his opportunity; and, given the followers and the circumstances, the opportunity would have been found and taken by some leader or other, if Muhammad and Alexander had never been born. If Muhammad, for instance, had failed, Maslamah would have found his opportunity. This question of the relation of leading individuals and minorities to the rest of society is discussed further on pp. 125-7, 148-50, and 305-6. As for the circumstances, the conquests of the Roman and the Sasanian Empire by Muhammad's successors and of the Achaemenian Empire by Alexander were surely not mysterious nor even unpredictable. In retrospect, both these revolutionary events look as if they had been more or less inevitable. When once the Achaemenian Empire had tried and failed to conquer the Hellenic World, it was probable that there would be an Hellenic counter-offensive, and that this would be successful as soon as it was made by the Hellenes' united forces under a single command. Similarly, the successful over-running of the south-eastern provinces of the Roman Empire by the Arab transfrontier barbarians might have been predicted from the previous success of the Teutonic and Eurasian Nomad barbarians in over-running the western provinces. The simultaneous overthrow of the Roman and the Sasanian Empire by the Arabs is explained by the exhaustion of the two empires as a result of their long series of wars with each other, culminating in the two particularly long-drawn-out and devastating wars of A.D. 572-91 and A.D. 603-28. The epiphany of Islam is explained by the radiation of the Syriac Civilization into Arabia during the preceding 2,000 years, and of the Hellenic Civilization during a period of about half that length. The attitude of Islam towards Hellenism had been foreshadowed in the attitudes of Monophysite and Nestorian Christianity. The rise of Islam is discussed further in Chapter XIV below, on pp. 461-76. As for the conversion of the Roman Empire to Christianity, this may no have been foreseen by Roman statesmen till half way through the third century of the Christian Era, but it was surely foreseeable long before that and had in fact been foreboded in the second century by Celsus. It was indeed the culmination of a victorious advance of Oriental religions into the Hellenic World which had begun at least as early as the fourth century B.C.—within a hundred years of the beginning of the Hellenic Time of Troubles.

Alexander illustrates Dawson's point not by the range and rapidity of his conquests but by the prematureness of his death. If Alexander had had as long a life as, say, his companion Ptolemy son of Lagus, who lived to be 84 and died in 284 B.C., the course of history might indeed have been different from what it has been. Yet the earliness of Alexander's death, though not inevitable, was also not mysterious and was even not unpredictable. If Alexander had truthfully filled in a life-insurance company's proposal-form at Susa in 324 B.C., the actuaries would certainly not have rated his expectation of life very high in the light of the way in which he had been taxing his stamina during the preceding ten years.

by action, and he prescribed for his disciples a course of ascetic spiritual exercises designed to burn these impurities away till nothing should be left but Absolute Reality in its negative aspect of 'extinguishedness' (*Nirvāṇa*). It is no accident that in India, where all indigenous schools of thought have agreed in disparaging the element of uniqueness in human affairs, there has been no notable indigenous school of historians. The first attempts, of any consequence, to write the history of India have been made by her Muslim and Christian invaders with their Judaic tradition of finding significance and value in temporal events. It is only in very recent times that, under Western inspiration, a Hindu school of historians on the present-day Western model has tardily come into existence.

Considering that some of the greatest historians who have made their appearance at any time and place have been Hellenic, it is remarkable that history should have been held in as low esteem in the Hellenic World, in theory at any rate, as it has been in India, and here, too, because of a contempt for what is unique.¹ This commonly accepted Hellenic view has been put pointedly by Aristotle in a famous passage.

'It is not the function of the poet to relate what *has* happened, but what *may* happen—what is possible according to the law of probability or necessity. The poet and the historian differ not by writing in verse or in prose. The work of Herodotus might be put into verse, and it would still be a species of history, with metre no less than without it. The true difference is that one relates what has happened, the other what may happen. Poetry, therefore, is a more philosophical and a higher thing than history; for poetry tends to express the universal, history the particular. By the universal I mean how a person of a certain type will on occasion speak or act, according to the law of probability or necessity; and it is this universality at which poetry aims in the names she attaches to the personages. The particular is—for example—what Alcibiades did or suffered.'²

After the renaissance of Hellenism in the modern Western World, this Hellenic attitude of mind survived Hellenism's discomfiture in the seventeenth-century 'Battle of the Ancients and Moderns' and was taken as a matter of course by the eighteenth-century school of Western philosophers. Though they had adopted the optimistic Confucian confidence in the perfectibility of human nature and had accordingly made a belief in 'progress' in human affairs into one of their cardinal doctrines, these eighteenth-century Western philosophers saw progress in terms solely of an impersonal movement on the grand scale. In their eyes the element of uniqueness in human affairs was something irrational, barbarous, and, above all, irrelevant. They regarded historians with the impatience that astronomers might feel towards geographers if these were to contend that it is more important to map out the mountains, valleys, and other minute irregularities in the conformation of the Earth's surface than it is to follow up the astronomical corollaries of the discoveries that our rough-coated planet is approximately spherical in

¹ This Hellenic attitude is touched upon again on pp. 124-5.

shape and that its orbit round the Sun describes a well-known mathematical figure.

This disparagement of uniqueness and irregularity, in favour of recurrence and uniformity, has been inherited from eighteenth-century Western philosophers by nineteenth-century and twentieth-century Western students of non-human nature. Natural science today has a great and growing prestige, and the method of analysis and classification, as opposed to the method of description and narrative, is now being applied to the study of human affairs in one province after another. Two distinguished living students of the archaeology of Nuclear America have declared that the ultimate purpose of archaeology is 'the discovery of regularities that are in a sense spaceless and timeless', and that the regularities investigated by archaeologists and by anthropologists are of one and the same order.¹ The method has even been winning converts in the historians' own camp. W. F. Albright has declared² that 'the historian of human culture . . . is just as much interested in discovering general laws as is the natural scientist, since every single phase of past—and present—culture has its own pattern of constituent elements'. It is not surprising that, at the present time, Western historians should be on the defensive, and should therefore be sensitive to any movement that looks to them like a fresh attack on their position with an eye to a further encroachment on the dwindling domain that still remains exclusively theirs.

At the same time they have to face the question whether their quest for the unique is a feasible one for human minds with their 'built-in' analytical and classificatory method of operation. Geyl insists³ that historical events are invincibly unique and asks⁴ whether the logic of class and instance is applicable to historical phenomena. This question has been answered conclusively in a report by the American Social Science Research Council's committee on historiography. 'Every historical event, however similar to others, is in some respects unique', because it has its own particular position in time. But,

'if every historical event were literally unique, history as science would be inconceivable. . . . No generalisations whatever would be possible; history and actuality would mean nothing, and any attempt to *understand* the past would be entirely futile.'⁵

This must be so, because

'To perceive is to assign to a familiar category; we could not perceive anything completely different from everything else that we have ever perceived before.'⁶ . . . All the unique objects of history which [the historian] studies are in fact either constant patterns of relations or repeatable processes in which the elements are of a generic character.'⁷

⁶ Hayek, *op. cit.*, p. 47.

⁷ *Ibid.*, p. 72.

'It is . . . only through some continuity and identity in the process that we are able to understand what the past is like. Some common ground inevitably serves as our bridge of interpretation.'¹

Geyl agrees² that 'the greatest function of the historian is to interpret the past'. Kroeber too points out³ that history aims at preserving the complexity of individual events 'while also constructing them into a design which possesses a certain coherence of meaning'. Deutsch points out that communications engineering 'does not transfer events'; it transfers information in the shape of 'a patterned relationship between events'.⁴ 'What interacts, has structure; and what has structure, can be known.'⁵ So

'Every historian has a philosophy of history, no matter how insipid or self-contradictory it may turn out to be if explicitly stated. . . . From the use of this kind of hypothesis [the vulnerable kind] no historian is or can be free, although historians differ in their awareness of their particular frame of reference.'⁶

'Any discipline of knowledge, whether theoretical or historical, can deal only with certain selected aspects of the real world.'⁷

'Like the natural sciences, history must be selective unless it is to be choked by a flood of poor and unrelated material. . . .'⁸

'Aiming at objectivity [the historians] feel bound to avoid any selective point of view; but, since this is impossible, they usually adopt points of view without being aware of them. This must defeat their efforts to be objective; for one cannot possibly be critical of one's own approach, and conscious of its limitations, without being aware of it.'⁹

'Uncritical analogies are the peculiar plague of the historian, and all too often insinuate themselves as ruling assumptions without the author's being aware of their dominance—hovering in the background of language beyond clear-cut intellectual or empirical check.'¹⁰ . . . Views of causal relations, social dynamics, and of the springs of human action tend to linger

¹ M. C. Swabey: *The Judgment of History*, p. 19. In Swabey's view 'the basic sameness in history which makes cross-reference possible would seem to be relational, a matter of scale and proportion, rather than of literal sameness of facts' (op. cit., p. 9). 'What appears as uniformity may be characteristic of the statistical method rather than characteristic of the individual originating phenomena' (ibid., p. 91). In the study of human affairs 'sooner or later retreat seems inevitable from empirical recurrence to relational common factors' (ibid., p. 91). 'It is because the World involves a unity of logical structure, a formal invariability through its varying content, that knowledge has power to survey and to connect the different domains of history' (ibid., p. 91). It will be seen that Swabey finds her uniformity in relations between phenomena, not in the phenomena themselves, and in the mind's procedure for dealing with these relations mentally rather than in an external world. But Swabey remains a believer in the reality of some kind of uniformity, nevertheless.

⁶ W. H. Coates: 'Relativism and the Use of Hypothesis in History' in *The Journal of Modern History*, vol. xxi, No. 1 (March, 1949). Cp. the passage quoted from Hales on p. 26. C. Trinkaus seems inclined to think that I am an exception to Coates's rule. In my work, he finds, 'a purely negative critical method was pursued that had as its result a theory of the universal incomprehensibility of the past, and hence of its eternal sameness' (*Science and Society*, vol. xii, No. 1 (1948), p. 221). Yet Trinkaus debits me with having a 'theory' of a sort.

⁷ F. A. Hayek, op. cit., p. 69.

⁹ Ibid., p. 152. ¹⁰ M. C. Swabey: *The Judgment of History*, p. 105.

in the background unaccredited and unannounced, while operating to control the narrative.¹

The truth is that 'no description of any individual object or event can dispense with predicates or abstract repeatable traits',² and that therefore 'no statement about the past can avoid some element of generality'.

'If . . . there is genuine novelty in the Universe and if events occur that have never occurred before, history must be an incomplete explanation of the present. In order to learn from the past there must be recurrences and similarities both throughout the past and between it and the present. There are enough recurrences and similarities to enable history to give us some account of the past and some explanation of the present. Thus our choices are at least partially illuminated and enlightened.'³

Change, novelty, and creation in human affairs are manifestations of the element of uniqueness in them, and one of the most cherished aims of historians is to catch creation, novelty, and change in their mental grasp; but they have to employ an instrument of thought which can analyse and classify points of likeness, but cannot cope with elements in phenomena that display no relation with any others. In seeking to apprehend what is unique, historians are, in fact, trying to swim against the current of the operational movement of the intellect.⁴ The gallantry of this endeavour deserves our sympathy, and its romance does not convict it of being a forlorn hope.

'Historical events and conditions are often unique simply in being different from others with which it would be natural to group them under a classification term—and different in ways which interest historians when they come to give their explanations. . . . It is thus misleading to say without qualification that the historian's use of classificatory words supports the thesis that, if historical events are to be explicable, they must be recurring phenomena.'⁵

If this is true, it is good news; for, if the historian's goal is an attainable one, this opens up a prospect of extending the bounds of human knowledge and understanding, by an intellectual *tour de force*, in a field that cannot be conquered by the straightforward scientific method of using the human mind's classificatory method of operation for classificatory purposes. It has been claimed that, at any rate since the turn of the nineteenth and twentieth centuries, human studies (*die Geisteswissenschaften*) have liberated themselves from the shackles of the natural sciences' method of thinking.⁷ Whether this claim is justified

⁵ 'The uniqueness of historical data poses a fundamental problem for the historian. His task is to describe and interpret. But to describe adequately he must necessarily understand what he wants to describe, and he cannot understand that which he cannot truly describe' (W. Altree in *Toynbee and History*, p. 243).

⁶ W. Dray: *Laws and Explanation in History*, pp. 47 and 48.

⁷ E. F. J. Zahn: *Toynbee und das Problem der Geschichte*, p. 6. Cp. Erdmann in the passage quoted on p. 16.

or not, for practical purposes there is everything to be said in favour of acting as if it were. As Kroeber has wisely observed,¹ the historical approach and the scientific approach are both alike applicable to any kind of phenomena in principle. And our human intellectual equipment is not so lavish that we can allow ourselves the luxury of forgoing any possibly efficacious method of using it. 'For the understanding of any concrete phenomenon, be it in nature or in society, both kinds of knowledge . . . the historical and the theoretical . . . are equally required. . . .² Theoretical and historical work are . . . logically distinct but complementary activities.'³ The historical-minded student of human affairs and his scientific-minded confrère are really indispensable to each other as partners in their arduous common undertaking. Sir Maurice Powicke⁴ has counselled his fellow historians to face 'the discomfort of the historic generalisation'. This is surely good advice; and conversely the scientific-minded student of human affairs should be advised to face the discomfort of the quest for what is unique.⁵

3. THE MIND'S QUEST FOR EXPLANATION

If it is agreed that historians, as well as scientists, are bound to make generalizations—even though this may not be the historians' aim—because making them is of the essence of thinking, whatever may be the object of our thought, the next question that presents itself is: How, in fact, are generalizations made? Dilthey is quoted⁶ as saying that

'part of the method of those studies that are concerned with human affairs is to maintain a constant reciprocal action between experience and concept. In these studies, the consciousness should not entertain any concept that has not arisen from an exhaustive historical resuscitation of past experience. It should accept no generalisation that is not an expression of the inwardness of some historical reality.'

This is a statement of an ideal but not a prescription for achieving it. So I will start *ad hominem* by declaring, as accurately and candidly as I can, the process by which I believe that I myself have arrived at the numerous generalizations that I have made about human affairs. Usually, I think, the process has started by my noticing some striking and interesting apparent resemblance between two or more events, situations, institutions, or other phenomena. These now present themselves as instances of the generalization that has been made on the strength of them. The next step is to survey as wide a range as possible of other cases that seem likely to be relevant. The purpose of this survey is to

¹ A. L. Kroeber: *The Nature of Culture*, p. 101.

⁴ F. M. Powicke: 'After Fifty Years' (1st January, 1944), in *Modern Historians and the Study of History* (London 1955, Odhams Press). The sentence here quoted will be found on p. 234.

⁵ C. B. Joynt comments, in a letter of 14th August, 1959: 'The "unique" school is on the same footing as the "law" school at the level of epistemology. The question as to which describes situations more adequately is an empirical question. Until we know more about human culture and behavior, the former will be able to score easy debating triumphs. The future lies with those who realize that you do not have to choose between these two approaches. They are not and cannot be mutually exclusive.'

⁶ In a paper by Otto Höfer, of which he sent me a copy in typescript.

ascertain whether this widening of the field of evidence bears out or conflicts with the generalization drawn from the original instances. This account of my own procedure and experience agrees, as far as I can see, with a description of the nature of historical research that has been cited in a report by the American Social Science Research Council's committee on historiography:

'Historical Research consists essentially in application of empirically derived hypothetical generalisations and in testing the closeness of the resulting fit, in the hope that in this way certain uniformities, certain typical situations, and certain typical relationships among individual factors in these situations can be ascertained.'¹

If there is any truth in these two virtually identical accounts of the process of generalization,² it would appear that the detection of connexions is what makes generalizations possible.³ But how do we detect them? 'By what right do we ever generalise from our experience? And how can we tell when we have a right to do so?'⁴ It is easy to tell when we have not a right. 'An empirical generalisation is at once overthrown by a contradictory instance.'⁵ One is enough.⁶ One instance will disprove a proposition. On the other hand, no finite number of instances will prove it.

It is obvious that there is no logical cogency in an enumeration of affirmative instances that is not, and does not profess to be, complete.⁷ Most, if not all, of my own numerous surveys of historical phenomena, made with a view to ascertaining whether some hypothetical generalization of mine will or will not hold water, have been incomplete—or, as logicians call them, 'simple'—enumerations; and it has been correctly pointed out by many critics that such incomplete surveys are not demonstrative, even if they have brought no contradictory instances to light.⁸ It is also true, though this is perhaps not so obvious to laymen, such as me, at first sight, that there would be no logical cogency in a complete enumeration either. 'Induction by complete enumeration, if the conclusion be understood as a genuinely universal judgement, and not as an enumerative judgement about all of a limited number of things, has the character of induction by simple enumeration.'⁹ Conclusions based on complete enumeration 'would not be universal truths at all in

¹ American Social Science Research Council's Committee on Historiography's Report (1954), p. 156, quoting A. Gerschenkron: 'Economic Backwardness in Historical Perspective', in *The Progress of Undeveloped Areas*, ed. by B. A. Hoselitz (Chicago 1952, University of Chicago Press), pp. 3-4.

² The process is discussed further on pp. 41-45, 158-66, 243-6.

⁴ *Ibid.*, p. 400.

⁵ R. B. Braithwaite: *Scientific Explanation*, p. 14.

⁶ Joseph, *op. cit.*, p. 392, footnote 1. 'The discovery of instances which confirm a theory means very little if we have not tried, and failed, to discover refutations. For, if we are uncritical, we shall always find what we want: we shall look for, and find, confirmations, and we shall look away from, and not see, whatever might be dangerous to our pet theories. In this way it is only too easy to obtain what appears to be overwhelming evidence in favour of a theory which, if approached critically, would have been refuted' (K. R. Popper: *The Poverty of Historicism*, p. 134).

⁷ 'His laws are not universally true, and his proofs of them not convincing' (A. Hourani in *The Dublin Review*, vol. 229, No. 470 (December, 1955), p. 382).

⁸ Joseph, *op. cit.*, p. 530.

⁹ *Ibid.*, p. 531.

the proper sense, but only truths about the whole of a limited number of particular facts'.¹ If complete enumeration of instances is held, as it was held by Aristotle, to be the only possible way of establishing general propositions, then 'we can never prove anything by reasoning until we already know it by direct experience'.² Anyway, there cannot be exhaustive enumeration where the units constituting the instances are individuals (individual things or persons or events or situations or institutions), not sub-classes of some class of individuals.³ All generalizations have the same status, whether their subject is human affairs or is physical nature. 'All scientific hypotheses will be taken to be generalisations with unlimited numbers of instances.'⁴ And, when the instances with which we are dealing are of a kind in which the number is apt to increase with the passage of time, we have to reckon, all the time, with an unknown future.

'It is a historic fact that the inductive policies of good scientific repute are effective-in-the-past policies; it is a general hypothesis that they are effective as well as being effective in the past.'⁵

This distinction is one of capital importance in any field of investigation—and therefore, among others, in the field in which the phenomena with which we are concerned are human affairs. I myself have never believed, and never contended, that the regularities, uniformities, and recurrences that, in my belief, are discernible in our record of the course of human affairs up to date are bound also to recur in the future. The most that I would infer from their past occurrence is that they *may* recur; we cannot, I believe, infer from it that they *must*. We must bear in mind all the time the possibility that

'an inductive policy . . . may fail in the future, either by its past successes turning out to be failures after all or by its failing to have future successes.'⁶

These considerations bring out the limitations of the scientific method, in whatever field it may be applied, as a strategy for trying to arrive at the truth about Reality.

'The imperfection attaching to the conclusions of inductive science—conclusions which are said to be reached by 'imperfect induction'—springs from the defective analysis of the instances cited, not from the failure to cite every instance; and it is a mistake to suppose that "perfect induction", if it could be employed—as it is acknowledged it cannot—would remove the defect of certainty attaching to scientific generalisations. For science seeks after the necessary and the universal, not after the merely exceptionless.'⁷

Joseph goes on to point out two of the weaknesses of scientific explanation:

¹ Joseph, *op. cit.*, p. 504.

⁴ Braithwaite, *op. cit.*, p. 14.

⁶ *Ibid.*, p. 268.

⁷ Joseph, *op. cit.*, p. 504. Philosophers of a different school might here comment that, if science does seek after the necessary and the universal, it is in quest of something that is unattainable.

² *Ibid.*, p. 381.

³ *Ibid.*, p. 384.

⁵ *Ibid.*, p. 268.

'It often starts with principles or truths or laws which are neither accounted for nor in themselves self-evident,¹ but only warranted by the success with which they account for the facts of our experience; and these principles are not absolutely and irrefragably proved, as long as any others which might equally well account for the facts are conceivable.'²

Accordingly, while conceding that 'it would be foolish to let these considerations engage us in a general and indiscriminate distrust of scientific principles', Joseph concludes that 'it must be allowed that the scientific account of Reality cannot be the ultimate truth'.³ Braithwaite likewise finds that "the quest for certainty" is, in the case of empirical knowledge, a snare and a delusion.⁴ 'A scientific "law" merely states probabilities.'⁵

The truth seems to be that 'the empirical evidence of its instances never proves the hypothesis . . . in the sense that the hypothesis is a logical consequence of the evidence'.⁶ . . . Induction must be considered, not primarily as induction by simple enumeration, but as the method by which we establish hypotheses within scientific systems.⁷

'The use of . . . particulars is, not to serve as the proof of a principle, but to reveal it. . . . They are the means used because some countable material is necessary in order to realise the general truth; but the general truth is not accepted simply because it is confirmed empirically by every instance.'⁸

'The reasoning which infers general truths from the analysis of a limited number of particulars does not rely on enumeration and is not an operation of the same kind as that which proceeds by complete enumeration. . . . [What it relies on is] an attempt to establish connexions of a causal character by analysis and elimination.'⁹

The 'apprehension of the necessary relation between . . . two terms, which our familiarity with particulars makes possible, . . . is the work of the intellect'.¹⁰ But the torch that the intellect has snatched out of the senses' incompetent hands is snatched away, in turn, by another faculty of the psyche. In the act of establishing general propositions, 'an incommunicable intuition takes the place of any process of reasoning'.¹¹ 'The induction is now a psychological rather than a logical process.'¹²

Under the guidance of practised logicians we have cursorily examined the nature of inductive reasoning and have noted the formidable difficulties which it encounters in its attempts to arrive at cogent demonstrations. On our way we have now caught a glimpse of the possibility

¹ 'The first or fundamental principles of science are themselves insusceptible of scientific explanation, and they usually also do not appear to be self-evident' (Joseph, op. cit., p. 503). 'We give reasons if we can, and turn to empirical laws if we must' (W. Dray: *Laws and Explanation in History*, p. 138). C. B. Joynt points out, in a letter of 14th August, 1959, that to demand demonstrations of initial assumptions would involve an inquirer in an infinite regress. In a letter of 16th September, 1959, he makes the point that 'the laws of physics or of history must be irreducibly contingent logically'.

that proof, even of the uncontestedly cogent kind which it has been claimed that deductive reasoning produces,¹ may not, after all, be the human mind's main objective. The goal of human thought may turn out to be, not proof for its own sake, but explanation. 'A scientific problem, as a rule, arises from the need for an explanation';² and, in the study of human affairs, 'the scientific function involves not only identifying and describing temporal sequences; it also involves explaining them'.³ 'Some explanation, implied or stated, is firmly planted in every history',⁴ for example. And the search for explanation is a quest for intelligibility.

'All thinking is an attempt to make experience more intelligible, and, so far as it is not intelligible, we assume our account of it to be untrue. It is for this reason that we are always recasting in thought the account of what appears in our experience.'⁵

When we are confronted with something that we do not understand, we try to make it intelligible to ourselves by tracing a connexion between it and something else that we believe we understand better.⁶ Explanation is essentially an act or process of reference.⁷

One step towards explaining a phenomenon is to find its context. 'Research into meaning cannot be free from synthesis, for only by putting anything into a wider context can its meaning be seen.'⁸ A fact cannot be established or made intelligible unless it is related to other facts or is part of a larger system.⁹

If I may venture to illustrate this point from my own work, I should say that volumes i-x of *A Study of History* hinge on two attempts to find 'an intelligible field of study' as a framework for a narrower field that I had found unintelligible when taken by itself without looking beyond its limits. The starting-point of the inquiry was a search for a more or less self-contained field of historical study of which the contemporary Western historians' customary national units of study would turn out to be parts. I had felt these national units to be unsatisfactory

¹ As Joseph sees it, inductive reasoning differs from demonstration in not making connexions intelligible (Joseph, op. cit., pp. 398-9). But he holds that a general proposition can be established either by 'insight into the necessity connecting the terms of the system of nature' or by 'appeal to particular facts' (ibid., p. 399); so, on his view, deductive and inductive reasoning are different without being contrary (ibid., pp. 396-7). The difference itself ceases to be clear-cut if even mathematical axioms (e.g. Euclid's) turn out not, after all, to be self-evident, as they have traditionally been taken to be.

⁶ Ibid., p. 502.

⁷ Presumably the act of referring something to something else implies that one has a better understanding of this other thing. The Israelites explained history to themselves by finding a meaning for it in God's purposes and in the action taken by Him for bringing about their fulfilment (R. L. Shinn: *Christianity and the Problem of History*, p. 33). This was perhaps, as is claimed by L. C. Stecchini (in *Midstream*, Autumn, 1956, pp. 84-91), the earliest of any attempts to explain history that have been made anywhere. In a rationalist's eyes it is an explanation of *obscurum per obscurius*. In a trans-rationalist's eyes it is a recognition of the presence of a Reality that is only partially revealed in the phenomena. The usage of the terms 'rationalist' and 'trans-rationalist' in this volume is explained on p. 72, footnote 3, and on pp. 75-76.

because they seemed to me to be un-self-contained, which would mean that they must be fragments of something larger. I found this larger unit of study in a species of society that I labelled a 'civilization'. Civilizations proved, so it seemed to me, to be intelligible units of study so long as I was studying their geneses, growths, and breakdowns; but when I came to study their disintegrations I found that, at this stage, their histories—like those of the national subdivisions of the modern Western World—were no longer intelligible in isolation. A disintegrating civilization was apt to enter into intimate relations with one or more other representatives of its species; and these encounters between civilizations gave birth to societies of another species: higher religions. At the beginning of the inquiry I had tried to explain the higher religions, like the national and other varieties of parochial states, in terms of civilizations. The last stage of my survey of the history of civilizations convinced me that this way of looking at the higher religions did not, after all, give anything like an adequate explanation of them.

It was true that the higher religions had served as 'chrysalises' in which disintegrating civilizations had undergone a metamorphosis and from which new civilizations of a younger generation had emerged. It was also true that this had been the higher religions' role in the histories of civilizations. But, in the histories of the higher religions themselves, this role turned out to have been not only an incidental one but actually an untoward accident in the sense that it had been apt to divert them from their proper task of carrying out their own missions. If I was to continue to pursue my search for some intelligible field of study that would provide an adequate context, and therefore a satisfactory explanation, for units of other species than nations and of other magnitudes—for instance, an explanation of civilizations—I now had to ask myself whether I ought not to reverse my previous plan of operations. If one species of society was to be explained in terms of another, ought not the civilizations of the first and second generations to be explained as preliminaries to the rise of the higher religions? These second thoughts about the identification of 'the intelligible field' of historical study, to which I had been led in the course of my inquiry, gave me a new point of departure; and the change of outlook, demanded by the necessity for a change of explanation, was a radical one. Christopher Dawson is right in defining it as a change from a cyclical system to a progressive system.¹ It was indeed so radical that many critics have been struck by it and some of them have suggested that, at this point, I ought to have wound up my original comparative study of civilizations and to have started a new inquiry into the meaning of human history in terms of religion.²

¹ Chr. Dawson in *Toynbee and History*, p. 131. K. W. Thompson, *ibid.*, pp. 207-12, traces my change of standpoint in greater detail. See also W. H. McNeill in *The Intent of Toynbee's History: A Cooperative Appraisal*. Geyl sees it (in *Toynbee and History*, p. 360), 'the new system springs naturally from' the old one.

Voegelin in *The Intent of Toynbee's History: A Cooperative Appraisal*; K. D. Erdmann in *Archiv für Kulturgeschichte*, xxxiii. Band, Heft 2 (1951), pp. 228, 234-8, 241, and 247; H. Werner in *Deutsche Vierteljahrsschrift für Literaturwissenschaft und Geistesgeschichte*, 29. Jahrgang,

In explaining something in terms of its context one is explaining it in terms of another thing that is more intelligible in virtue of its larger scale, but not necessarily in virtue of being of a different and intrinsically more intelligible nature. An explanation of this second type is evidently more illuminating. 'To explain a law is to exhibit an established set of hypotheses from which the law follows.'¹

In this more illuminating type of explanation there are any number of possible gradations of achievement. At the bottom of the scale of intelligibility are those generalizations that rest merely on induction. 'From an empiricist point of view, all explanations of actual events or features of experience take the form of showing that what is to be explained is, in itself or with some of its attendant circumstances, an example of a regularly recurrent pattern of events or aspects of events.'² But 'inductive conclusions are never seen to be intrinsically necessary, but only to be unavoidable'.³ Accordingly, they 'present . . . a blank wall to our intelligence'.⁴ However, 'having explained some event or feature of an event as an instance of some recurrent regularity, it is always legitimate to go on and ask for an explanation of that regularity';⁵ and one may succeed in explaining it in terms of another regularity that is wider in its range or more lucid in its degree of intelligibility or has both these explanatory features.⁶ 'Complete explanation would only come if the law which the facts had forced us to recognise should, when considered, appear self-evident.'⁷ This ideal is most nearly approached in mathematical propositions. In these the necessity of the relations has been held to be transparent,⁸ and, even if this view of them is contested, it will probably be agreed that they stand at the top of the scale of intelligibility. Most of my own explanations of historical phenomena are of the comparatively opaque inductive kind. 'An historical pattern has been shown, but not a logical cause.'⁹

Mathematical relations are apparently transparent because mathematical entities are not phenomena but abstractions. Abstractions can be made simple and precise in the degree in which they eliminate the

unique essence of Reality. In mathematical abstractions this process of elimination is carried to extremes. By comparison with mathematical abstractions, phenomena, even those of the non-human kind, are complex and elusive. Human phenomena are more complex and elusive still. Bagby observes¹ that, in the comparative study of civilizations, 'qualitative rather than quantitative considerations play a primary role'. *Ad hominem*, it is not surprising that J. K. Feibleman is struck by 'the low abstractive level' of my work in earlier volumes of the present book. 'The result', he pronounces, 'is not the highly abstractive logical and quantitative structure which it ought to be, but something still qualitative and indeed almost literary in its approach.'² I do not question Feibleman's report, but I do demur to his requirement. What he is demanding is, I believe, a counsel of perfection for a student of human affairs. In attempts to explain human affairs, complete transparency is most unlikely to be attainable. I agree with another philosopher's dictum that we should be underestimating the limitations of finite human minds if we were to claim that our minds can find the whole of human history intelligible, even if we help ourselves out by trying to explain history in terms of God's sovereignty, instead of confining our horizon to the field of human action.³

4. THE RELATIVITY OF EXPLANATION TO OUTLOOK

It will be seen that the objective of both 'explanation' and 'demonstration' is intellectual satisfaction, and that the achievement of this is the warrant that the objective has been attained. In this sense 'demonstration', as well as 'explanation', is a subjective experience. On the other hand, 'demonstration', in contrast to non-demonstrative 'explanation', is objective in the sense that we do not regard a demonstration as being valid and authentic unless an identical intellectual satisfaction is found to be experienced by all minds that have followed out the particular train of reasoning in question,⁴ whereas an explanation may give different degrees of intellectual satisfaction to different minds and may, indeed, give full satisfaction to some minds while giving none at all to others, so that 'explanation' is not only subjective but is also relative.⁵

³ R. L. Shinn: *Christianity and the Problem of History*, p. 45. Cp. C. B. Joynt in *The Australasian Journal of Philosophy*, vol. 34, No. 3 (December, 1956), pp. 195-202.

⁴ 'Scientific proof is public, not private' (J. Needham: *Science and Civilization in China*, vol. ii (Cambridge 1956, University Press), p. 515). 'The burden of demonstrating the significance of the pattern he has selected is on the historian. . . Empirical hypotheses are not private visions but public assertions' (C. B. Joynt in *The Australasian Journal of Philosophy*, vol. 34, No. 3 (December, 1956), p. 202). In a letter of 14th August, 1959, Joynt points out that the meteorologist's and the shaman's explanations of a thunderstorm, cited below, differ in the point that the meteorologist's explanation is testable, whereas the shaman's is not. Even, however, if the meteorologist's explanation passes all tests available at the moment to the satisfaction of all minds that have followed this train of reasoning, its validity is still no more than provisional, as we have seen.

⁵ W. Dray insists on this point that explanation is not equivalent to prediction and verification (*Laws and Explanation in History*, p. 59). K. R. Popper appears to be making the same point when he says, with reference to the historians' approach to the study of human affairs, that 'there is necessarily a plurality of interpretations, which are fundamentally on the same level of both suggestiveness and arbitrariness' (*The Poverty of Historicism*, p. 131). In Popper's terminology, however, 'interpretation' and 'explanation' are not synonymous, and the word 'explanation' seems to be used (see *ibid.*,

This point is illustrated by the plurality of satisfying explanations of a thunderstorm. Minds educated to adopt the intellectual outlook that is customary in the present-day Western World will accept the explanation in terms of the regular and predictable working of inanimate physical forces—temperature, barometrical pressure, electricity, and so on—that is offered in a meteorological observatory's report. Perhaps only one layman in a thousand really understands the meaning of an explanation of this scientific kind; but the other nine hundred and ninety-nine accept it with little less confidence by taking it on faith. People living in a society with a non-scientific outlook will likewise take on faith the explanation of the same thunderstorm that is given to them by authorities who are the experts in their eyes. They will take it from these interpreters of the phenomenon that the thunderstorm is produced by the capricious and unpredictable whim of a god riding on the clouds, and that the 'thunderbolt' is this god's physical weapon with which he visits his anger on mankind. The meteorologist's explanation would seem not merely unilluminating but incredible to the shaman's clientele, just as the shaman's explanation would seem not merely incredible but ridiculous to the meteorologist's public. Here we see two incompatible explanations of the same phenomenon respectively giving intellectual satisfaction to two sets of human beings that share our common human nature but happen to have been brought up in two different cultural milieux.

It will be noticed that the relativity of intellectual satisfaction to the cultural milieu of the inquiring mind is something inherent in the human situation common to all men, and that this common mental limitation cannot be overcome by any increase in intellectual sophistication, however great.

'Even the physical sciences start with some assumptions concerning the nature of things.¹ Still more does any treatment of history. Empirical operations in history are always limited by the intellectual presuppositions of the author, and there is no escape from this rule.'²

5. THE EXPLANATORY USE OF ANALOGY

The relativity of the value of an explanation, in terms of giving or not giving intellectual satisfaction to different publics, or, for that matter, to different minds in one and the same cultural milieu, is also illustrated by differences of opinion about the explanatory value of the use of analogy.

Analogy, like all other kinds of attempts at explanation, is an interpretation of something that seems comparatively obscure in terms of

pp. 122-3) to mean something more cogent than 'interpretation'. In Popper's view 'the use of a theory for predicting some specific event is just another aspect of its use for explaining such an event' (ibid., p. 124) and 'there is no great difference between explanation, prediction, and testing' (ibid., p. 133). I am using the word 'explanation' to mean what Popper means by 'interpretation'.

¹ Cp. Joseph, quoted on pp. 24-25. C. B. Joynt, in a letter of 14th August, 1959, points out that presuppositions, assumptions, and hypotheses are, all alike, provisional, expendable, and replaceable.

² C. A. Beard in *The American Historical Review*, vol. xl, No. 2 (January, 1935), p. 309.

something else that seems comparatively transparent. Joseph brackets analogy with 'simple enumeration'. 'Both point to a general principle which, if it were true, would account for the facts from which we infer it.'¹ 'Neither', he continues, 'prove its truth.' But nevertheless he endorses a dictum of J. S. Mill's that 'there is no analogy, however faint, which may not be of the utmost value in suggesting experiments or observations that may lead to more positive conclusions'.²

The weakness of analogy as a method of thought seems to lie, not in the nature of the method itself, but in the nature of most of the phenomena to which it is applied. In mathematics the argument from analogy is accepted as being valid.³ Indeed, 'the most fruitful developments of modern mathematics can almost all be analysed into the application of old ideas to new fields'.⁴ This is because the entities with which mathematical thought operates are simple and precise abstractions, and the use of analogy in the sense of finding 'proportion' between different sets of such entities cannot lead the user intellectually astray. The possibility of error arises when the entities between which he is drawing an analogy are not mathematical abstractions but are observed phenomena. Two or more phenomena may have facets which genuinely correspond with each other and between which analogies can therefore properly be drawn. Here we may fall into error by failing to abstract the genuinely corresponding features precisely,⁵ or by making the unwarrantable assumption that an analogy which holds good just for these facets is also applicable to the phenomena in their entirety; for this means treating the non-comparable facets of these phenomena as if they too were comparable, when they are not.

A case in point is the kind of explanation of non-human phenomena of which my imaginary shaman's explanation is one example. Human beings find themselves buffeted by forces, some of which are exerted by their fellow human beings and others by non-human phenomena. Since the exertion of force is a common activity of both kinds of agency, and since, of the two, the human kind is the more familiar, and therefore seems the more transparently intelligible to human minds that have not been initiated into the science of psychology, people living in a non-scientific-minded cultural milieu explain the action of a thunderstorm, torrent, or bull in terms of the action of a strong and angry man. Their error, of course, lies in their uncritical assumption that all the external forces that they encounter are forces of one single kind, obeying one single set of laws, and that these universal laws of force are identical with the particular laws with which they are most familiar, namely the laws of the behaviour of human beings of like passions with themselves.

From the standpoint of those of us who have been brought up in a scientific-minded cultural milieu, this reading of human behaviour into the action of inanimate nature, and even the reading of it into the action of creatures that are alive but are not human, is an unwarranted use of

¹ Joseph, *op. cit.*, p. 540. Cp. p. 541.

² J. S. Mill: *System of Logic*, III. xx. 3 *med.*

³ Joseph, *op. cit.*, p. 532.

⁴ Cohen, *op. cit.*, p. 249.

⁵ Joseph, *op. cit.*, p. 532.

analogy that makes nonsense of these phenomena.¹ We have labelled this error 'the pathetic fallacy' and the practice of it 'mythology'. But if we maintain that mythology is an erroneous use of analogy to which non-scientific-minded people are prone, we must also admit that there is an inverse error—let us call it 'the apathetic fallacy',² and call the practice of it 'counter-mythology'—which consists in interpreting human conduct in terms of the action of non-human animals and of inanimate nature.

This is an error into which we are prone to fall in our modern Western World. We have been dazzled by the successes of our men of science in explaining phenomena to us and in justifying their explanations by successfully bringing the phenomena under human control as a result of handling them on the assumption that the explanations correspond to the realities. The earliest successes of our modern Western scientists in finding explanations that proved to be keys to establishing control were in the field of inanimate nature. They then extended their operations to the study of the material structure and working of living organisms. Finally they have applied their method to the study of the spiritual constitution and conduct of human beings—the study of human affairs, as I have called it in this book. As a result of this course that the development of modern Western science has taken, the most familiar kind of phenomenon for a modern Western scientist is the inanimate kind. It is this kind that he has succeeded in explaining to himself the earliest, and also the most to his own satisfaction. It is therefore natural that, when he ventures into the, to him, comparatively unfamiliar field of human affairs, the scientist, like the shaman, and indeed like any other human being, should try to illuminate what is less familiar to him by putting it in terms of something that he feels he understands better. He is tempted to use his physiological, biological, chemical, physical, and mechanical terminologies for interpreting social and cultural phenomena, and this misuse of analogy is no less misleading than the shaman's. The obscurity of human affairs is intensified, instead of being clarified, when they are described in non-human terms—however familiar these terms may be and however well they may have served their users when they have been applied in their own proper contexts.³

¹ K. W. Deutsch in *Philosophy of Science*, vol. 18, No. 3 (July, 1951), pp. 230–52, points out on p. 231 that the use of a human society as a model for non-human nature leads to the practice of magic.

² See the present book, I, 7–8 and 271.

³ The classic example—dating from long before the rise of modern Western science—of an analogy applied to human affairs from a different level of phenomena is the description and explanation of society in terms of physiology. I myself believe that this particular analogy is wholly misleading (see pp. 268–9 and 271–2). In a letter to me of 8th January, 1936, F. J. Teggart writes: 'One of our habits of thought—and it is part and parcel of our intellectual make-up—is the use of the organic analogy in dealing with the problems of culture and society. The use of the analogy is as old as the beginnings of European thought; this is *not* a demerit, but the employment of the analogy means that our outlook on the world (of culture) is restricted to one way of looking at things.'

A sharp critique of the apathetic fallacy in the work of one school of recent Western historians will be found in M. C. Swabey: *The Judgment of History*, pp. 93–95 and 108–10. 'Who ever heard... of a mechanism without any consciously invented machinery? Of selection without purposive choice? Of warfare without cognisance or intent? Discredit is brought upon history by such wholesale borrowing from the blind, inhuman world for

Of course the conscientious use of human terms for describing human affairs is not, in itself, a safeguard against falling into error through a misuse of analogy. For instance, the hypothesis of a primordial 'social contract' as an explanation of the origin of human society is misleading, in spite of its being an interpretation of a human affair in human terms, because it seeks to explain an obscure event in one kind of social milieu by reference to an institution that is non-existent in this kind of milieu and is to be found only in a different one that happens to be more familiar to the inquirer. The making of contracts between human beings is possible only when these are already in social relations with each other and when their society has become well enough established and sophisticated enough to have inaugurated the reign of law over human relations. To project this rather mature social situation back into a pre-social state of affairs as an account of how society came into existence is an attempt to explain society's origin in terms of one of its eventual products. This is evidently an erroneous analogy from a social state of human affairs to a supposed pre-social state of them. It does not give the explanation that it purports to give. Yet the error involved in this misleading account of the obscure origin of human society in terms of a social contract is at any rate far less gross than the error involved in the 'counter-mythological' attempt to explain the same event by the use of terms applicable only to inanimate nature, such as 'gravitation', 'attraction', 'fusion', 'conglomeration', 'crystallization'.

A classical illustration of the 'counter-mythological' variation on the misuse of analogy is the conjuring up of the pseudo-science of astrology through the drawing of an unwarranted analogy between the movements of human affairs and those of the heavenly bodies. In Babylonia in the eighth century B.C. astronomers made the discovery that the relative positions of the Sun, the Moon, and the five then known planets in regard to each other at a particular moment recur regularly at a uniform interval of time which the discoverers labelled 'the Great Year'. This mighty manifestation of regularity, uniformity, and recurrence in the movements of the stellar cosmos was so impressive and exciting that its makers jumped to the conclusion that they had found the key to the workings of everything in the Universe. They would not have been far wrong if they had been content with concluding that everything—or almost everything—was subject, like the heavenly bodies, to some kind of 'law' in the sense of 'laws of Nature': that is, apparent regularities that have been revealed by observation, and, so far, have not been shown by it to be illusory. This has been the finding of modern Western science, and it has been found to hold good not only in the case of non-human nature but in the case of the sub-conscious element in human nature too—if we accept the findings of the newly fledged science of psychology. Where the Babylonians went astray was in their further assumptions that there was nothing in the Universe that was exempt from the rule of 'the laws of Nature', and that these laws were all

the interpretation of human happenings. . . . How much better, says common sense, for historians to choose their analogues from human life rather than from inhuman, impersonal worlds, thus avoiding far-fetched comparisons' (pp. 109-10).

comprised in a single code which governed all kinds of phenomena alike. Actually, it is non-proven that the apparent partial freedom of human consciousness, purpose, and will is illusory; and, in so far as human nature may be partially subject to 'laws', there is no warrant at all for assuming that the laws of psychology and the laws of physics are identical with each other or even similar to each other, or, short of this, that they are geared together in some mechanical way. So far from that, it looks as if the realm of 'laws of Nature' were articulated into a number of different provinces, each with its own provincial code of laws, so that, while the whole realm is under the reign of law of some kind, different codes of law are valid simultaneously in different areas.¹ The Babylonian astronomers who became the fathers of astrology went wrong, not in drawing their analogy, but in pressing it to unwarranted lengths.

Notwithstanding these monitory examples of the misuse of analogy, it is nevertheless true that a prudently discriminating use of it can be fruitful even in perilous fields as well as in the safe field of mathematics. One daring and, no doubt, hazardous use of it for the extension of the range of thought and language has been justified by its continued and cumulative success. As far as we can guess, the original vocabulary of human speech must have been limited to a number of ejaculations supplemented by a few imperatives and even fewer indicatives, and the earliest essays in these parts of speech must all have been expressions of an experience of those phenomena that are immediate data of the senses. In societies which have risen above the primitive cultural level and have started on the enterprise of civilization, this original nucleus of Man's vocabulary has been buried under the vast successive additions that have been made to it. We have built up our vocabulary—and, with it, the thoughts that it expresses—into a huge inverted pyramid, and the new materials for this invaluable mental structure have been produced by the use of analogy.

Our ideas of, and our words for, spiritual presences, actions, and experiences are derived from words and ideas denoting material things, sensations, and events. Our ideas of, and words for, abstractions are derived from concrete objects from which the abstractions have been elicited by an intellectual *tour de force*. In thinking and talking about what is abstract in terms of what is concrete, and about what is spiritual in terms of what is material, we must have been drawing an unwarranted analogy and therefore must have been exposing ourselves to the risk of misrepresenting and misunderstanding those elusive spiritual and abstract aspects of Reality that we have represented to ourselves in imagery borrowed from material and concrete aspects of it that are immediate data of the senses. This enormous extension of the range of human language and thought is, in fact, a product of analogy; yet, in this crucially important instance, the resort to analogy seems to have justified itself by its results. For example, we successfully make mathematical calculations with mental tools originally fashioned for other uses. The very word 'calculation' means playing about with pebbles as counters. Yet, in making the abstractions required for calculation, we

¹ See E. F. J. Zahn: *Toynbee und das Problem der Geschichte*, pp. 9-11.

have not lost touch with Reality, as is witnessed by the effectiveness of the application of mathematics in technology and also, far more convincingly, by the impression of self-evident truth that mathematical reasoning makes on our minds.

Cohen points out¹ that 'the number of available analogies is a determining factor in the growth and progress of science'.

'The ancient doctrine of atoms led to plausible speculations but became a useful scientific idea when the development of mechanics enabled us to apply the analogies of billiard balls and statistics to groups of atoms.'²

Cohen also reminds us that our mental picture of the internal structure of an atom is an analogy drawn from our knowledge of the solar system. We have constructed our theory of gases on the analogy of capillary action. The structure of star clusters has given us a clue for developing the electron theory of electricity. We have successfully explored the behaviour of electricity by thinking of it in terms of the behaviour of a fluid. We have discovered some of the physical properties of the planet on whose surface we live by thinking of it as if it were a magnet or the needle of a compass. Our notion of the independence of the biological cell and our theory of genes are analogies from our atomic theory. Our notion of the way in which natural selection 'works' is an analogy from our knowledge of the way in which a human breeder of animal livestock works.³

In this last instance we are taking the personal work of a human being endowed with a consciousness, a will, and a purpose as a clue for understanding the character of 'work' of another kind. This other kind of 'work' is, in the modern Western scientist's view, *ex hypothesi* something impersonal, unconscious, and unpurposive, in opposition to the Jewish-Christian-Muslim belief in acts of creation by a God conceived of in the likeness of an almighty human being. The analogy from a human breeder to an impersonal 'breeding force' may or may not bring us nearer to the truth⁴ than the older analogy from a human breeder to a superhuman 'creator', but this older analogy at least has the advantage of being the less far-fetched of the two, and it may be doubted whether the new analogy would have been attainable by human minds if they had not previously provided themselves with this older and nearer one to serve as a stepping-stone for their striding imagination.

To continue our recital,

'The discovery of the circulation of the blood by William Harvey was at any rate partly inspired by the known relation of the Sun to the meteorological water circulation cycle.'⁵

But Harvey also partly found his way to his discovery by thinking of the heart, arteries, and veins in terms of man-made pumps and valves. And other human artefacts have given clues for explaining, not only the

¹ Cohen, *op. cit.*, p. 249.

² *Ibid.*, p. 252.

³ All these examples of fruitful analogies in the field of science are given by Cohen in *op. cit.*, p. 250.

⁴ For an adverse verdict on it, see Swabey, *op. cit.*, p. 109.

⁵ J. Needham: *Science and Civilization in China*, vol. ii (Cambridge 1956, University Press), p. 298.

physical 'structure' and 'working' of living organisms, but also the ways of Man and even the ways of God. Analogies have been drawn from the wheel to explain the revolutions in human affairs as well as those in the movements of the heavenly bodies. The clock has been taken as a model not only in astronomy and physiology but also in political science and theology. Schiller wrote of 'the watch-spring of the Universe'. Tom Paine called God 'the first mechanic'. The Pyramids have provided a sensuous image of a hierarchical social structure. The potter has served as a prototype for a creator god. A pair of scales has become a symbol for justice. The weaver's thread and web have become symbols of Reality (*Wirklichkeit*) itself.¹

At the present moment we can watch the advance of technology once again giving Man the craftsman a new clue to a better understanding of his own psychic nature. Since the nineteen-forties 'a new science about an old subject' has made its appearance under the name of cybernetics. Today there is

'a growing division of labour between human minds and an ever-growing array of electronic or other communications, calculating, and control equipment. . . . By continuing to make . . . equipment which fulfils . . . functions of communication, organisation, and control, we cannot help in the long run but gain significant opportunities for a clearer understanding of those functions themselves. . . . [Cybernetics] uses the facilities of modern technology in order to attempt to map out, step by step, the sequence of actual events in getting these operations accomplished. . . . As simplified models, [calculating machines] can aid our understanding of more complex mental and social processes. [What this may give us is] a generalised concept of a self-modifying communications network or "learning-net".'²

No doubt, each time that we resort to the method of analogy, we are courting the risk of misapplying it.³ Yet the use of analogy has certainly been a fruitful device, and perhaps an indispensable one, for Man in his sustained mental endeavour to take his bearings in the mysterious Universe into which he finds himself born. He has wrested valuable results not only from analogies between kindred phenomena, but also from the more far-fetched 'mythological' analogies drawn from human conduct to the behaviour of non-human animals and to the processes of inanimate nature, as well as from 'counter-mythological' analogies drawn from the processes of inanimate nature to human affairs. I agree, for my part, with M. C. Swabey's dicta⁴ that, 'since all knowledge proceeds through the detection of resemblances, in dealing with objects largely beyond empirical check, analogy must be appealed to', and that, 'despite the pitfalls of analogy, history has its roots in it'.

¹ All but the first of the examples cited in this paragraph are given by K. W. Deutsch in 'Mechanism, Organism, and Society: Some Models in Natural and Social Science', in *Philosophy of Science*, vol. xviii, No. 3 (July, 1951), pp. 232-4.

² *Ibid.*, pp. 239-41.

³ 'The [analogical] method . . . comes from a dangerous and subtle form of mysticism which has been widespread in all ages. It makes it possible to prove and to believe almost anything. One of the best-known examples of its use was the proof of a whole cosmogony and religion from the analogy of a watch' (L. S. Woolf in *The New Statesman and Nation*, 23rd September, 1939).

⁴ In *The Judgment of History*, p. 75.

In the history of modern Western science there is one instance of the use of a 'mythological' analogy which is as famous as it has been fertile. Darwin has recorded that, at a stage in his inquiry into the origin of species at which he was making no further progress in the direct approach to his problem, he happened to read one of Malthus's works expounding his theory that, in human society, there is a tendency for the growth-rate of the population to forge ahead of the growth-rate of its food supply, and that this results in a struggle for life. In this celebrated economic hypothesis Darwin found the clue that led him to his own still more celebrated biological hypothesis. Conversely, Deutsch, the exponent of the new science of cybernetics who has been quoted just above, claims for it that it is a promising line of inquiry because it is throwing light on the working of human minds from the working of Man's latest artefacts. He finds that 'the striking parallels and suggestive insights' into the working of human affairs that are offered by concepts drawn from human history have 'remained empty of inner structure'. For example, my own "creative minorities" are unanalysed vessels of a creativity which itself has no intrinsic details that could be described and understood'. Deutsch finds Joseph Schumpeter's concepts of 'creativity' and 'innovation' in the field of economics likewise unfruitful for the same reason. Schumpeter and I, he suggests, have drawn blank because we have taken human society itself as our model for explaining processes of human organization.¹ Deutsch's point may be expressed analogically as the doctrine that, in the use of analogy, as in the process of evolution and in the practice of the breeder's art, in-breeding makes for sterility, cross-breeding for fertility.

Whether or not this particular analogy is justified by the evidence of results, I myself have been commended by some critics and censured by others on the ground that I have in fact used analogy in the cross-fertilizing way that Deutsch recommends.² I have also been censured for using analogy to excess,³ for using it in its mythological form

¹ Ibid., pp. 237-8.

² H. Kuhn notes in *The Journal of Philosophy*, 28th August 1947, pp. 489-99, on p. 497, that I use analogy both 'horizontally' (i.e. in the in-breeding way) and 'vertically' (i.e. in the cross-breeding way). 'Vertical' analogy, as Kuhn defines it, 'puts together phenomena of different types or of different structural levels'. He pronounces that 'denying the legitimacy of this second kind of analogical reasoning would be tantamount to denying the possibility of philosophy'. At the same time he stipulates that, 'in order to be legitimate, . . . the use of vertical analogy must strictly observe the rule of hierarchy'. On the other hand, Richard Pares (in *The English Historical Review*, vol. lxxi, No. 279 (April, 1956), p. 271) remarks that, 'if Dr Toynbee rejects mechanical analogies, he falls victim to the far more dangerous biological analogies'. O. H. K. Spate (in *The Geographical Journal*, vol. cxviii, Part 4 (December, 1952), p. 419) warns against 'the danger . . . of anthropomorphising nature'. C. A. Beard (in *The American Historical Review*, vol. xl, No. 2 (January, 1938), p. 309) objects that 'the introduction of analogies from biology and physics into historical thought (a practice which most of us are guilty of) does violence to the actuality of history and adds to confusion rather than to knowledge'. K. R. Popper quotes a passage of the present book (vol. i, p. 176) as an example of the misapplication of terms taken from physics to sociology (*The Poverty of Historicism*, p. 112). L. S. Woolf (in *The New Statesman and Nation*, 23rd September, 1939) objects to my fondness for 'comparing the phenomena observable in the growth or disintegration of civilizations to the phenomena observable in radiation or in the diffusion or diffraction of light'. On the other hand, John Strachey, in a letter to me of 3rd August, 1950, writes: 'I like best of all your "radiation" way of putting it.'

³ Analogies: 'Handle with caution' (P. Geyl in *Toynbee and History*, p. 66). Toynbee ought to chasten his metaphors and prune his analogies (Sir Ernest Barker, *ibid.*, p. 97).

concurrently with the scientific method of reasoning,¹ for using it as a substitute for reasoning,² and using it, in its mythological form, at all.³

Poetry, myth, and metaphor are over-used (M. S. Bates in *Christianity and Crisis*, vol. 15, No. 4, 21st March, 1955, pp. 27-30 and 32). There is too much intuition, mythology, and argument from analogy in Toynbee's work (O. H. K. Spate in *Toynbee and History*, p. 291, and in *The Geographical Journal*, vol. cxviii, Part 4 (December, 1952), p. 407). Toynbee goes too far in trusting analogy (Kuhn, in loc. cit., p. 492). 'Some analogies one feels to be strained or even false' (R. T. Clark in *The Nineteenth Century and After*, November, 1941). His use of analogy is an illustration of the recklessness of his ways of thinking (O. H. K. Spate in *Toynbee and History*, p. 303). Cp. A. Eban *ibid.*, pp. 330 and 331, and Sir Llewellyn Woodward in *The Spectator*, 6th July, 1934.

¹ Toynbee drives science and poetry in double harness (K. W. Thompson in *Toynbee and History*, p. 201). Zeus is not evidence (G. J. Renier, *ibid.*, pp. 74-75). Toynbee ought not to mix myth with scientific thinking (E. F. J. Zahn: *Toynbee und das Problem der Geschichte*, p. 36). 'Arguments which . . . have a curious way of coalescing with their imaginative illustrations so as to form philosophical myths' (Kuhn in loc. cit., p. 489). One cannot be historian and philosopher simultaneously (D. B. Richardson in *The Thomist*, vol. xx, No. 2 (April, 1957), p. 164). 'His determination to mix genres' (W. Kaufmann in *Toynbee and History*, p. 306). 'In Toynbee's interpretation of history there is an uncertainty which in a way seems to mirror the mind of the author, who is at the same time both a mystic and a scholar proud of the capacity of the human intellect' (H. Holborn in *The Saturday Review of Literature*, 31st May, 1947). 'His myth of history' (E. E. Y. Hales in *History Today*, April, 1955, p. 322). 'There can be no compromise on such a vital point. Either we have history or we have myth. No half-way house is possible' (C. B. Joynt in *The Australasian Journal of Philosophy*, vol. 34, No. 3 (December, 1956), p. 200). According to O. F. Anderle in an unpublished paper nine-tenths of the criticism of my work is directed against my reunion of science with myth. In Anderle's own view, true myth embraces everything, including science. See further p. 130, footnote 3.

² 'At times . . . the constructive artist in him . . . triumphs over the carefully weighing historian.' A simile or metaphor may become an end in itself and be taken as an explanation or a 'law' into which facts can be forced (G. Weil in *Toynbee and History*, p. 282). There is an ambiguity between the use of analogy as illustration and the use of it as argument. Ought metaphors to be allowed to persuade and control, besides just illuminating? In Toynbee's work 'the form and the content are organically related. . . . Thus every aesthetic aspect of the work involves the question of truth' (E. Fiess, *ibid.*, pp. 282-3). Toynbee's images 'seem sometimes for their author to take on an independent life and vitality of their own' (W. H. McNeill in *The Intent of Toynbee's History: A Cooperative Appraisal*). 'Analogy is not proof' (R. H. Tawney in *International Affairs*, November, 1939, p. 802). Toynbee's simile of the hedgehog illustrates but does not prove the continuity of the history of the Syriac Civilization (A. L. Kroeber: *The Nature of Culture*, p. 376). 'Analogy is essential in history, but not all historians judge by analogy alone' (Pares, in loc. cit., p. 268). Visual images 'are often used, not as embellishments, but as structural parts of the arguments, not as aids to exposition, but as substitutes for thought' (M. Postan in *The Sociological Review*, vol. xxviii (1936), p. 57). 'Again and again, beginning with a suggestive simile or metaphor, he ends by accepting the metaphor as proof of identity' (L. S. Woolf in *The New Statesman and Nation*, 23rd September, 1939). 'His lavish metaphors and similes, allegories and parables, suggestive as they sometimes are, are too often assumed to possess evidential value' (R. K. Merton in *The American Journal of Sociology*, vol. xlvii, No. 2 (September, 1941), pp. 205-13). Toynbee systematically falls into the confusion of historical illustration with historical proof (S. Hook in *The Partisan Review*, June 1948, p. 693). 'He is . . . doing what he censures in Spengler: that is, setting up a metaphor and then proceeding to treat it as a basis for argument' (A. R. Burn in *History*, February-October, 1956, p. 11). 'The exposition proceeds by analogies, by parables, and by quotations from philosophy and poetry. This method can never prove anything, for other parables, analogies, and quotations can, in the same way, prove the opposite' (O. Handlin in *The Partisan Review*, July-August, 1947, pp. 171-9). Toynbee has turned history into mythology (T. J. G. Locher in *De Gids*, May, 1948, p. 21).

³ Toynbee deals in myths (G. J. Renier in *Toynbee and History*, p. 74). In the present age people who take myth seriously are derided (Anderle, unpublished paper). 'Whatever else history is, it is not myth. The essence of mythology is an effort to state by means of metaphors and analogies experiences which transcend the senses. There can be a history of myths but there can be no history which consists of myths as part of its structure of meaning. At such a point, history becomes metaphysics, religion, or poetry' (Joynt in loc. cit., p. 201). This uncompromising view is not, however, taken by all rationalist-minded critics. For instance, F. H. Underhill generously declares (in *The Canadian*

I have also been offered an acquittal on condition of my agreeing to be labelled a poet, or even a musician, rather than an historian.¹

I plead guilty to having carried my use of analogy to excessive lengths. I should have guessed that I might have made this mistake, even if I had not been accused of it by a convincing consensus of critics. I am conscious that 'going too far' is a standing temptation for me, and that too often I have succumbed to it. I agree that analogies are not explanations, but are heuristic devices for seeking explanations.² I also confess myself in error if it has been proved against me that I have used mythological analogy as a substitute for scientific reasoning (i.e. used it in contexts in which scientific reasoning would have been not only feasible but also more enlightening). This would be wrong, because science and mythology are two different ways of trying to explain phenomena, and they ought not to be confused with each other or used in each other's place. Up to this point my critics and I agree. But some of them will certainly disagree with me when I go on to express my belief that neither of these two approaches can do duty for the other, and that scientific reasoning cannot serve as a substitute for mythology. In earlier passages of this chapter I have touched upon the universally admitted limitations of the human reason's power to apprehend Reality by its analytical and classificatory method of working. The method of mythological analogy is, no doubt, a still more imperfect instrument for trying to apprehend Reality

Historical Review, vol. xxxii, No. 3 (September, 1951), pp. 201-19) that Toynbee's 'profusion of colourful and stimulating metaphors and similes, his skillful use of myth and poetry, philosophy and religion, to throw light on the past experience of Man in society, all this has reminded us that Clio is a muse and not merely a pedestrian statistical social scientist'.

¹ Is Toynbee's use of myths meant to be merely confirmatory or is it meant to be evidential? The historians are left guessing. 'Is the historian's loss the poet's gain? . . . It is not a work of history. . . . Taken as a whole, it is a huge theological poem' (E. Fieiss in *Toynbee and History*, pp. 380 and 383). 'The historian is a poet and the history is his poem' (T. S. Gregory in *The Dublin Review*, vol. 220, No. 440 (Spring, 1947), pp. 74-87). 'His . . . insights are not those typical of the historian, but rather those of the prophet, the seer, the poet, the mystic' (F. H. Underhill in *The Canadian Historical Review*, vol. xxxvi, No. 3 (September, 1955), pp. 222-35; cp. vol. xxxii, No. 3 (September, 1951), pp. 201-19). 'His Approach is poetic, intuitive' (Chr. Hill in *The Modern Quarterly*, Autumn, 1947, p. 295). 'His habit of mind is poetic, and it would be a mistake not to recognize his book as a prose epic, whatever else it may be besides' (W. H. McNeill in *The Intent of Toynbee's History: A Cooperative Appraisal*). Toynbee's work is 'an imaginative vision of history having the same relation to fact as has poetry' (A. Hourani in *The Dublin Review*, vol. 229, No. 470 (December, 1955), p. 382). 'Toynbee is writing history fundamentally as a poet and moralist and not as a scientific historian' (Hook in loc. cit., p. 692). 'At his best his theory is a kind of wild and tragic poetry softened by an ill-defined but clearly amiable religious faith and charity' (D. G. Macrae in *The Literary Guide*, January, 1955). 'The secret of Toynbee's greatness is that he is a poet and something of a mystic' (David Thomson in *The News Chronicle*, 14th October, 1954). 'As a poet, Toynbee is remarkable' (P. Geyl in *Debates with Historians*, p. 143). 'A . . . revival of . . . "the Christian Epic"' (H. E. Barnes in *An Introduction to the History of Sociology*, p. 719). 'Is Toynbee perhaps preparing the way for some future poet to write a new *Divina Commedia* or *Faust*?' (K. D. Erdmann in *Archiv für Kulturgeschichte*, xxxiii, Band, Heft 2 (1951), p. 236). Toynbee's history is a mythological drama (J. K. Feibleman in *T'ien Hsia Monthly*, vol. ix, Nos. 1 and 2 (1940), p. 172). The intelligible unity that Toynbee finds in history is the unity of a drama (McNeill, op. cit.). 'He writes like a musician, developing his motifs in a series of academic variations' (R. H. S. Crossman in *The New Statesman*, 8th March, 1947). Crossman evidently does not think that this should earn me an acquittal; and M. Savelle concedes that there is poetry in history without conceding that an historian can be granted poetic licence (*The Pacific Historical Review*, vol. xxv, No. 1 (February, 1956), pp. 55-67).

² This distinction is drawn by C. B. Joynt in a letter of 14th August, 1959.

than scientific reasoning is; the gleams or hints given to us by mythology are unverifiable; but, in compensation for its greater weakness, mythology has a wider reach than science and a deeper penetrative power.¹ Moreover, if there is truth in the account, given above, of the part played by the use of analogy in the progressive extension of the range of language and thought, then it is no accident that mythology has arisen earlier than science as a means of explanation, and poetry earlier than prose as a vehicle of expression. It also seems likely that mythology has a role to play, as a means of explanation, always and everywhere, not only in fields which science has not yet succeeded in entering, but also in those in which science has now established itself. For, even in long-since occupied territory, science's hold is never more than partial and incomplete.²

I therefore join issue with critics who take me to task for driving science and mythology in double harness. So long as we recognize and advertise that this mental equipage is a carriage-and-pair and not a one-horse shay, I believe that we can use it without misleading either ourselves or the public. I also believe that the two steeds, side by side, can carry us farther than either steed can by itself, and that a reconnaissance made by this method will not turn out to be a wild-geese-chase. The method is Plato's,³ and his practice of it accounts for almost everything in his work that has proved to be of high enduring value. The Platonic conception of the place of myth in philosophy has been admirably expressed by Dean Inge:

'When the mind communes with the world of values, its inevitable language is the language of poetry, symbol, and myth. . . . Philosophy has to deal with a number of irreducible surds which cannot be rationalised. . . . Our reason . . . has reached its limits. We are driven to mythologize, confessing that we have left the realm of scientific fact.'⁴

As for being labelled a poet, I should be glad to be convinced that I deserve the title,⁵ but I should not take this as acquitting me of the charges made against me that I have cited. What matters is not the name by which one is called but the extent of one's failure or success under any name or none. In the study of human affairs one cannot afford to neglect any approach. One must be free to resort to the different methods of the poet, the historian, and the scientist in turn, according to the nature of each piece of the task;⁶ and, in order to enjoy this free-

¹ Like Vico, Toynbee has 'an understanding of myths as containing the essential truths of history' (J. K. Feibleman in *T'ien Hsia Monthly*, vol. xi, Nos. 1 and 2 (1940), pp. 165-6). Bagby allows that 'myths seem to be an essential part of the fabric of social life', and his proviso that 'they should not be allowed to stand in the way of a more rational understanding of history' will not be disputed—at any rate, not by me. See P. Bagby: *Culture and History*, p. 2.

² O. F. Anderle suggests that true myth embraces everything, including science (unpublished paper, cited already on p. 38, footnote 1).

³ W. H. McNeill observes that my use of myth and metaphor is in the Platonic tradition (*The Intent of Toynbee's History: A Cooperative Appraisal*).

⁴ W. R. Inge: 'The Place of Myth in History' in *Philosophy*, vol. xi, No. 42 (April, 1936), p. 131.

⁵ I have never written poetry in the formal sense in any other languages than Greek and Latin.

⁶ 'Historians must be both researchers and artists' (K. W. Thompson in *The Political Science Quarterly*, vol. lxxi, No. 3 (September, 1956), p. 367).

dom to use all the methods, it is best not to be tied to any of the corresponding names.

6. THE HEURISTIC USE OF HYPOTHESES

In the act of thinking we inevitably make two unprovable assumptions. One is that our thought apprehends, if only partially and imperfectly, a Reality that exists independently of it and is not just the mind's own mental construction.¹ Our second assumption is that Reality has some meaning for us which is accessible to us by the mental process of explanation.² We assume that Reality makes sense, even if perhaps not completely. That is to say, we assume that there is at least a certain amount of order and regularity in the relations between the myriad phenomena into which our image of Reality is dissected in our consciousness. 'We cannot treat the World as a mere succession of events.'³ 'Science and sanity postulate a World in which there are certain fixed characters.'⁴ 'All induction *assumes* the existence of connexions in Nature, and . . . its only object is to determine between what elements these connexions hold.'⁵ Two expressions of this assumption are the beliefs in the uniformity of Nature⁶ and in causation. Since this is true of all thought, it is true of thought about human affairs. 'The historian employs concepts and hypotheses because of the general assumption that underlies all social science: history is not exclusively chaos or chance: a degree of observable order and pattern, of partially predictable regularity, exists in human behaviour.'⁷

The assumption of the uniformity of Nature underlies all inductive reasoning—and much more of our stock of beliefs is based on inference than on experience. This assumption is not verifiable from experience. If we ask what justification we have for making it, all that we can say is that to deny the uniformity of Nature is to resolve the Universe into items that have no intelligible connexion with each other.⁸

One of the reasons why science has made unprecedented progress in modern Western hands is the practice, by scientists of this school, of virtues that are moral quite as much as intellectual. They have had the courage to create hypotheses for explaining the phenomena, the honesty to give their hypotheses up when these have not been borne out by the results of the investigations in which they have been used,⁹ and the versatility to exchange them for others when, without having been refuted, they have been utilized up to the limits of their usefulness. All

¹ 'The choice among rival lines of division is an essential part of the process of rational inquiry. But, once such choice has been made, it is the nature of the pie or the Universe that determines the content of each part or division' (Cohen, *op. cit.*, pp. 67-68). Scientists act on 'a belief that the Universe is rational, not derived from experience, but controlling the interpretation of experience' (Joseph, *op. cit.*, p. 506).

² R. L. Shinn makes the point that meaning is the basis, not the conclusion, of thought and definition (*Christianity and the Problem of History*, p. 16).

³ Joseph, *op. cit.*, pp. 404-5. Cp. p. 426.

⁴ Cohen, *op. cit.*, p. 86.

⁵ Joseph points out *ibid.*, pp. 402-3, that a belief in the uniformity of Nature is not inconsistent with a belief in Nature's variety.

⁷ Social Science Research Council's Committee on Historiography's Report (1954), p. 95.

⁹ A classic example (cited by Bagby in *op. cit.*, p. 3) is Kepler's abandonment of Plato's *a priori* hypothesis that the orbits of the planets must be circular.

our currently accepted propositions, generalizations, and 'laws' are merely hypotheses that have not been discredited by experience so far.¹ 'All theories are trials: they are tentative hypotheses, tried out to see whether they work; and all experimental corroboration is simply the result of tests undertaken in a critical spirit, in an attempt to find out where our theories err.'² But 'theory is not necessarily bad because it is hypothetical, tentative, and not yet conclusively demonstrated or rejected'.³ And 'theory that runs beyond the established data is the source of fertility in cumulative scientific analysis'.⁴ The formation of an hypothesis may be likened to an act of artistic creation⁵ or to the manufacture of a tool.

'A calculus is an artefact, and the interpretation of a calculus is a resolution to employ this artificial tool in a particular way.'⁶

Kroeber uses the word 'tool' to describe his key-concept, 'culture', and adds that the word applies to every concept.⁷ One significant characteristic of tools is their number and variety.⁸ Each of them is designed for doing a particular job. No tool is omniscient. There is no such thing as a master-key that will unlock *all* doors.⁹ If we treat an hypothesis as a mental key, we shall discard it if we find that it unlocks no doors at all, and put it down for the moment in order to try another if, after having successfully opened a number of doors with its aid, we eventually come to a door into whose lock it does not fit.¹⁰ But, when we do lay aside a well-tried key, we must not forget that it did unlock the previous doors. While it is true that there is no hypothesis that explains everything, this does not mean that each of our hypotheses is not good as far as it goes.¹¹

This is what is meant by saying that the value and validity of hypotheses, and of those organized systems of hypotheses which we call

¹ 'The effectiveness of [an inductive] policy is an empirical proposition which does not logically follow from the policy's effectiveness-in-the-past' (Braithwaite, *op. cit.*, p. 269). This consideration governs the question of the validity of predictions made on the strength of scientific laws. 'The function of a scientific law . . . is . . . that of organising our empirical knowledge so as to give both intellectual satisfaction and power to predict the unknown. The nature of scientific laws cannot be treated independently of their function within a deductive system. The World is not made up of empirical facts with the addition of the laws of Nature: what we call the laws of Nature are conceptual devices by which we organise our empirical knowledge and predict the future' (*ibid.*, p. 339).

² K. R. Popper: *The Poverty of Historicism*, p. 87.

³ Social Science Research Council's Committee on Historiography's Report (1954), p. 139.

⁴ *Ibid.*, p. 137.

⁵ Joseph, *op. cit.*, p. 525. It is noteworthy that this simile should have been adopted by an austere-minded logician.

⁶ R. B. Braithwaite, *op. cit.*, p. 69.

⁷ A. L. Kroeber: *The Nature of Culture*, p. 118.

⁸ Joseph, *op. cit.*, p. 459, points out that we need alternative classifications for different purposes; Cohen, *op. cit.*, pp. 67-68, that we need to choose between alternative classifications for each particular purpose.

⁹ For instance, Geyl points out that it is impracticable to think of history exclusively in terms of the units that I call civilizations, and that this is demonstrated by my own practice of citing instances from the histories of smaller units, notwithstanding my contention that civilizations are the smallest units that are intelligible fields of study (*Toynbee and History*, pp. 71-72).

¹⁰ Romaine rightly insists that one ought to be prepared to drop a theory as soon as it has fulfilled its function (*ibid.*, p. 348).

¹¹ Braithwaite, *op. cit.*, p. 269, points out that there may be an exhaustion of the field for the profitable exploitation of a policy without the policy's past successes being impugned on this account.

sciences, is no more than 'heuristic' (i.e. exploratory)¹ and 'operational' and 'instrumental'. For instance, the usefulness of dialectical patterns, such as 'thesis-antithesis-synthesis' and 'challenge-and-response', is 'heuristic and operational; it must depend on their effectiveness in suggesting new fruitful questions, experiments, or techniques in dealing with problems'.² In Deutsch's expectation, modern control engineering may give us other patterns that will be more fruitful and suggestive.³ 'An operational theory is one that is stated in such a way that it can conceivably be proved false by reference to empirical evidence.'⁴ The theories used in social science 'are not statements of eternal and immutable truths; they are, rather, statements that may possibly provide valid explanations'.⁵ 'Concepts are instrumental. They are formulated for the purpose of enlarging human understanding and are themselves subject to growth and change.'⁶ 'The formulation of a law is arrived at with the "implicit proviso to modify it on the basis of later experiences".'⁷ 'For the historian, . . . generalizations are hypotheses which he can use to open up a subject and suggest lines of approach, discarding, adapting, or continuing with them, as they prove fruitful.'⁸ 'The only ultimate test of such provisional instruments of thought is neither their clarity nor their truth, but whether they lead to any useful results.'⁹ 'No theory is definitive; every theory is provisional only. A theory will have yielded the best performance of which it is capable if it has kept going the flow of research.'¹⁰ 'To study history in terms of *problems*, some theoretical framework and *some* working hypotheses are unavoidable.'¹¹ The purpose of putting forward heuristic hypotheses is

¹ See Chapter VII, pp. 243-6, and Chapter II, Annex: *Ad Hominem*, pp. 641-2.

² Deutsch, loc. cit., p. 245. Cp. Zahn, op. cit., p. 9. ³ Deutsch, *ibid.*

⁴ Social Science Research Council's Committee on Historiography's Report (1954), p. 28. In the same passage, Spengler's theories and mine are denied the benefit of this definition. 'Their theoretical structures should not be taken as examples of the use of social science methods' (*ibid.*, p. 28. Cp. pp. 92-93). 'Toynbee's generalisations . . . must be elaborated to be testable propositions—an elaboration that the author does not provide' (*ibid.*, p. 109). As O. F. Anderle puts it in his paper, my theorizing runs ahead of my verification of it. My verification of my hypotheses, he finds, is my obvious weak point. In K. R. Popper's view, this weakness is inherent in the historians' approach to the study of human affairs. 'As a rule, . . . historical "approaches" or "points of view" cannot be tested. They cannot be refuted, and apparent confirmations are therefore of no value, even if they are as numerous as the stars in the sky' (*The Poverty of Historicism*, p. 151). Here Popper is applying to the case of the historians a general proposition of his that has been quoted already on p. 23, footnote 7. An instance of a thesis that is intrinsically untestable, and is not merely so far untested, is found by C. B. Joynt in my Biblical conception of the freedom of human wills as being a freedom to obey or disobey 'laws of God' (*The Australasian Journal of Philosophy*, vol. 34, No. 3 (December, 1956), pp. 195-202).

⁸ A. Bullock in *History Today*, February, 1951, pp. 5-11.

⁹ G. A. Birks in *Philosophy*, October, 1950, pp. 336-40. *Ad hominem*, P. Kecskemeti observes, in *The Modern Review*, vol. 1, No. 4 (June, 1947), pp. 308-13, that 'the real test of Toynbee's theory is heuristic and empirical'. Kecskemeti judges that I am justified in my method, but that my basic concepts are too few to bear, without strain, the load that I have put upon them.

¹⁰ Anderle, op. cit. ¹¹ Social Science Research Council's Committee on Historiography's Report (1954), p. 132. Bagby, in op. cit., p. 202, assigns this status to his 'conceptual framework'. Anderle points out, in his unpublished paper, that some of my critics do not seem to

to make approaches towards the attainment of new knowledge and understanding by a dialectical interplay of intellectual action and reaction.¹

have realized that, in the activity of thinking, hypotheses have a role that is not merely legitimate but indispensable. 'It is', he writes, 'astonishing to find—especially in Geyl and critics of his school—that they apparently dispute an inquirer's right to be convinced of the validity of his own observations, conclusions, and proofs and to build these into the process of his thinking. Criticism can, of course, demonstrate that this or that point is untenable and, in doing so, sometimes bring to the ground an entire theoretical structure. But criticism cannot object to the procedure in itself, since, without this procedure, there can be no progress in scientific thinking. In the criticism of Toynbee's work, a particularly great part has been played by the reproach that he has anticipated his conclusions (*der Antizipationsvorwurf*). . . . Yet not a single participant in the debate has gone into the underlying epistemological problem. All the critics who bring up against Toynbee the reproach that he works with "anticipatory schemas" (*antizipierende Schemata*) seem to be quite unconscious of the fundamental importance of this function of all thinking—including, of course, their own. They appear to hold the naïve view that complex ideas are arrived at by the additive process of stringing together ideas of a more or less elementary kind. This is a point of view that has been left behind long ago in the modern psychological study of thought. The field of inquiry has shifted to the discussion of heuristic and verifiatory method. The criticism directed against anticipating results seems to have overlooked this development, at any rate when it has been turned against Toynbee. Consequently it has missed fire.'

In another passage in his paper, Anderle makes the point that 'any man of learning is within his rights in arranging the material known to him in accordance with his theory, in order to see how far this will carry him. He has a right to do this without taking into consideration, for the moment, the possibility that contrary instances may come to light in the course of his researches.'

Of course, the inquirer ought to test the validity of his hypothesis or 'model' (see pp. 22–23 and 158–66) by applying it to all the apparently relevant evidence on which he can lay hands, and seeing whether it does or does not fit the phenomena. But, to apply an hypothesis or a 'model', one must have it in hand; one cannot have it without having first constructed it; and the materials out of which one constructs it cannot embrace all the evidence to which it is going to be applied after it has been constructed (see pp. cit.).

The line of criticism that Anderle criticizes may be illustrated by some examples. What Geyl says of me is that 'he introduces into his argument his own theoretical construction as an established datum' (*Toynbee and History*, p. 56). In M. A. Fitzsimons' view, my 'philosophy of history even dictates the organisation and selection of material' (*The Review of Politics*, October, 1957, pp. 554–5). In T. R. Fyvel's view, my work seems 'in the end frustrated, because it had always to be fitted into a pre-conceived brief' (*The Tribune*, 21st March, 1947). H. Werner finds in my work an 'external application of pre-fabricated schemata' (*Deutsche Vierteljahrsschrift für Literaturwissenschaft und Geistesgeschichte*, No. 29 (1955), pp. 528–44). J. K. Feibleman compares 'the iron rigidity' of my system to 'the medieval torture device of the iron woman' (*T'ien Hsia Monthly*, vol. xi, Nos. 1 and 2 (1940), p. 23). Patrick Gardiner compares my work to a jigsaw puzzle whose parts interlock only because they have been constructed to do so (*Time and Tide*, 30th October, 1954). See further p. 246, footnote 6.

On the other hand, Father M. C. D'Arcy holds that 'every great historian begins with a theory, and though he modifies it in the face of evidence, he is nevertheless driven by it to select his evidence and marshal his facts' (*The Sense of History*, p. 60). 'The function and gift of the historian is to ask questions' (*ibid.*, p. 59). E. E. Y. Hales holds that I am justified in contending 'that some interpretation, implied or stated, is firmly planted in every history' (*History Today*, May, 1955, p. 323). Father D'Arcy, too, maintains that 'history uses interpretation; it seeks for an intelligible pattern or whole' (*op. cit.*, p. 23). The true historian has a theme and finds significance (*ibid.*, p. 16). M. R. Cohen observes that 'philosophies of history are none the better for being held and transmitted unconsciously' (*The Meaning of Human History*, p. 5; *cp.* p. 35) and points out 'the essential role of ideas or hypotheses in the activity of the historian' (*ibid.*, p. 68; *cp.* p. 78). 'Effective investigation demands some previous division or classification' (*ibid.*, p. 65). 'The mere accumulation of facts will not indicate their significance. Some general idea or anticipatory hypothesis is necessary to define our field of investigation and to determine what facts are relevant to our inquiry' (*ibid.*, p. 204). 'Men generally observe only what their ideas have prepared them to observe' (*ibid.*, p. 204). In other words, if we did not have these antecedent ideas, we might fail to see anything at all; at the same time, we must be on guard against the danger that they may also limit our horizon.

¹ On this dialectical procedure, see further the Annex to Chapter II, pp. 641–2; E. F. J. Zahn in *Toynbee und das Problem der Geschichte*, p. 15; H. Marrou in *Esprit*, July, 1952, p. 124. Zahn and Marrou are referring particularly to my treatment of civilizations. In Marrou's view (expressed *ibid.*) civilization looks more like a real entity in

This purpose presupposes a readiness to modify or abandon an hypothesis if sufficient cause for doing so has been shown as a result of the test of debate.

But, if the use of hypotheses is indispensable, it also has at least one besetting danger: 'the habit of treating a mental convenience as if it were an objective thing'—an error that, in academic language, is called 'the hypostatization of methodological categories'.¹ This is a confusion into which it is notoriously easy to fall unconsciously, because hypotheses and generalizations and concepts are, after all, realities, though they are realities of a different order from that of the phenomena which they are designed to apprehend, handle, and explain. This is, of course, a failure to distinguish between tools and their products or, to use broader terms, between means and ends.

In this connexion I have been accused of introducing into my argument my own theoretical construction, not just as a working hypothesis, but as an established datum,² and also of having 'an anthropomorphic conception of civilizations'.³ I confess to having frequently written of them in anthropomorphic language, but this is not because I conceive of them in anthropomorphic terms. I think of them as operational concepts—'intelligible fields of study'—which are useful for exploring and explaining some important provinces of the domain of history, though not the whole domain. I also think of them as institutions: that is, as networks of impersonal relations between human beings. It is possible for them to be both these things at once. But of course neither concepts nor institutions are persons.

The reason why I do, nevertheless, use anthropomorphic language in dealing with civilizations is because I am driven to it by the poverty of the English language so far—a poverty that it shares, I believe, with all other languages up to date. Even the most sophisticated languages hitherto evolved have continued to be prisoners of all language's sensuous and mythological past, and consequently have failed almost entirely to equip concepts and institutions with vocabularies of their own,

a still-life cross-section tableau than when we look at it on the move. "The essential point is that one should not make what is really a label or a classificatory concept into an idea or an ontological principle."

Burn in *History*, February-October, 1956, pp. 2-3; W. O. Ault in *The Journal of Bible and Religion*, April, 1955.

² P. Geyl in *Toynbee and History*, p. 56 (quoted already in footnote 11 to p. 43); F. H. Underhill in *The Canadian Historical Review*, vol. xxxvi, No. 3 (September 1955), pp. 222-35 (quoted already in the Introduction to this volume, p. 1, footnote 5). Cp. E. E. Y. Hales in *History Today*, May, 1955, p. 320: 'He writes as though the principles he thinks he perceives were laws in the Newtonian sense.' A. L. Guernard, in a review of vols. i-iii of this book in *The Herald-Tribune*, 28th October, 1934, writes that Toynbee 'seems to forget, and he makes us forget, that his "laws" are valid only as hypotheses and approximations'. The same indictment has been made against H. T. Buckle by M. C. Swabey. 'Loose generalisations are quickly converted into premises for arguments, and the mere plausibility of conjectures is taken for their substantiation' (*The Judgment of History*, p. 84).

³ W. Kaufmann in *Toynbee and History*, p. 310. H. D. Oakeley observes that 'there is a tendency in his work to "personify" civilization or treat it as something more than the individuals who, like many Atlases, "bear it up"' (*Philosophy*, vol. xi, No. 42 (April, 1936), p. 191). M. R. Cohen observes that to ascribe conscious purpose to groups is mythology (*The Meaning of Human History*, p. 125).

referring distinctively and exclusively to these two orders of reality. In the study of biological evolution, for example, the creation of a non-anthropomorphic vocabulary has been proving difficult, though it has been one of the main concerns of scientists in this field to dispense with the hypothesis of a creator god. The linguistic situation is even worse, if that is possible, in the field of human studies; but here the difficulty of avoiding the use of anthropomorphic language in writing about civilizations is, I should say, neither greater nor less than when one is writing about other institutions: states, peoples, churches, religions, classes, professions, and so on. I do not believe that any historian has, so far, ever managed to write more than a page or two of narrative without using 'anthropomorphic' or some other form of 'hypostatical' language in some degree. If I can be confronted with an instance to the contrary, I will admit that this verbal misrepresentation of the realities is avoidable and that, in so far as I have failed to avoid it, I deserve to be taken to task.

One test of whether the user of a concept or an hypothesis does think of it as being something more than a mental tool will be the degree of his readiness or unreadiness to drop it. In an appraisal of my work Kroeber writes, with characteristic generosity:

'His formal scheme presumably will mostly go the way of sociologic fit-alls. Actually, however he himself may regard it, this scheme has served him well as a scaffold from which to rear a most stimulating structure of further comparative interpretation of a large part of human history.'¹

Another critic has given the correct answer to Kroeber's query. He has reported that I do not claim to have discovered any absolute, universal laws.² Anderle, in his survey of criticisms of my work, has found that some critics have ignored my recognition of the truth that all historical work is no more than provisional.³ But at least one critic has testified in my favour on this point.

'One has the feeling that Toynbee, unlike Spengler, is really trying to subject his historical laws to empirical tests, and that he would have the integrity and the modesty, if given sufficient reason, to modify or abandon his laws.'⁴

I have done, and shall go on doing, my best to justify this good opinion of my intellectual honesty. In the first ten volumes of this book I have already given proof of my good faith in an instance which I apologize for mentioning again, after having cited it already, earlier in this chapter, in a different context. I laid aside my original hypothesis about the historical relation of 'higher religions' to 'civilizations' when I found that, while this might serve to explain the transition from an

³ O. F. Anderle in his unpublished paper.

⁴ W. H. Coates: 'Relativism and the Use of Hypothesis in History' in *The Journal of Modern History*, vol. xxi, No. 1 (March, 1949), p. 27, footnote 14.

earlier civilization to a later one, the role of higher religions as 'chrysalises' for civilizations was, in their own histories, no more than an incidental one that did not explain their true mission. Accordingly, I tried a new hypothesis about the relation of civilizations to higher religions, to see if this would be more illuminating as an explanation of the higher religions' histories. This change of tools is, I should say, an indication that I have a greater respect for the historical evidence than I have for any particular hypothesis that I happen to have picked out of my tool-bag. A large part of the present volume is occupied by similar reconsiderations of concepts and hypotheses used in volumes i-x. I have reviewed my previous notions and, where I have found reason, have gone on to modify or abandon them. I have aimed at treating my own past work no more tenderly than I should have treated anyone else's. How far I have succeeded in achieving this ambitious aim will, no doubt, be easier for my critics to judge than it is for me.

II. THE RELATIVITY OF A HUMAN OBSERVER'S APPROACH TO HUMAN AFFAIRS

AT the beginning of the preceding chapter we have taken note of Reality's feat of looking at itself through a part of itself in the shape of a conscious human mind. This feat is achieved through a mental self-articulation of Reality into subject and object in the diffracting mind of a human observer. This is an indispensable condition for attaining consciousness and for thinking. 'It is methodologically impossible to dispense with the viewpoint of *some* observer.'¹

If this diffracting mental operation could have the effect of dividing Reality itself into two really separate entities, our human enterprise of finding our way about the Universe would be easier than it is. The supposedly actual division in Reality corresponding to the mental dissection of Reality in our consciousness would then be like the pane of glass in the window of a conning-tower. By looking out of its mental window the mind could observe the objective world; by turning round and looking inwards it could also observe itself; and it could conclude that, after having taken its observations in both directions, it had obtained an accurate picture both of itself and of external Reality. Unfortunately, in making our assumption that there is an effective division in Reality corresponding to our dissection of it, we are, as we know, doing violence to the very Reality that we are trying to apprehend. The pane of glass in our simile cannot really be an insulator. It is an inseparable part of the same Universe as the adjoining atmosphere in the landscape beyond its outer face and in the room inside its inner face. The glass, by its interposition, makes a link, not a break; and, if the glass is really there, this is evidence that room and landscape are both really parts of one and the same Universe, while, if the apparent presence of the glass pane between them is an hallucination, in that case they are still more obviously one

¹ H. and M. Sprout: *Man-Milieu Relationship Hypothesis in the Context of International Politics*, p. 65.

and indivisible. The observing mind is, in fact, itself part of the Universe that it is trying to observe.¹ And this reading of our simile is borne out by everyday experience in a world in which there are more observing minds than one. Each mind is a subject only from its own individual standpoint. From the standpoint of every other mind, it is one of the objects in each of these other minds' objective world. And, if we found ourselves not being regarded by other minds as being objective realities, we should be astonished, affronted, and, even more, alarmed.

What are we to make of this undeniable truth that an observing human mind is itself part of the Universe, in spite of the Universe's appearing, as the mind surveys it, to lie outside the mind and, conversely, appearing to be observed by the mind from a mental standpoint outside the Universe? This truth means that the problem of observation is not an easy but a difficult one, and that, though it seems to be solved for practical purposes in the act of observation, this practical solution cannot be more than partial and imperfect. One necessary condition for perfect observation might appear, at first sight, to be that, during the act of observation, both the observer and his object should remain constant, without either of them being modified by the other or by any third agent. On second thoughts, however, it becomes evident in the first place that this condition is actually unattainable and in the second place that, if one could imagine it to have been attained, it would have defeated its own object by making the act of observation impossible to carry out. There cannot be observation without interaction between the observer and the object under his observation, and in interacting they are bound to affect each other reciprocally.² In terms of our simile of the conning-tower, the observer posted in it affects the degree of visibility in the landscape outside when he turns his search-light on it, and the vision of the landscape given by this illumination of it affects the image obtained by the observer's eye. Moreover, if this reciprocal disturbance of both parties' previous state did not take place, there could be no observation, because the disturbance is set up—and this unavoidably—by the establishment of communication, and it is only through this disturbing operation that the act of observation is achieved.

The logical puzzle here brought to light is also illustrated by another of the mind's dissections of Reality: the dichotomy between creatures and their creator. In seeking to explain to themselves how the phenomenal world can have come into existence, some human minds in some societies have been led to propose the hypothesis that there must have been a creator. But a creator must, *ex hypothesi*, be outside his handiwork, as a potter is outside his earthenware, while at the same time he must be in contact with it, as the potter has to be with his clay. This logical dilemma has caught on its horns the inquirers into the riddle of cosmogony when they have become sophisticated enough to begin to philosophize. A god who is credited with having been the creator of the phenomenal world has to be banished from it by being relegated into a state of transcendence; yet, when once he has been thus placed in a

¹ See the passage quoted from Teilhard de Chardin on p. 8, footnote 3.

² This point is noted by Bagby in *op. cit.*, p. 60.

possible position for performing the work of creation, he has thereby been deprived of the possibility of carrying the operation out. A complete insulation will have made him impotent, not omnipotent. If he is to create the Universe, he must be in contact with it. If he is to create it out of previously existing materials, he must be inside the same world as these; they themselves cannot be his handiwork; and their previous existence has then to be accounted for. On the other hand, if the creator has to create the phenomenal world out of nothing but himself, then in reality it will still remain a part of himself and the phenomena will be no more than unaccountable hallucinations in human minds that will also be unaccountably conscious.

Accordingly, the intellectual struggle with the problem of creation has made speculative minds first push God out of the phenomenal world and then pull Him back into it again. When He has been conceived of as being transcendent, He must also be conceived of as being immanent. If He is Brahṁā, He must be Vishnu as well. But God Incarnate in an avatar cannot be the creator of a Universe of which He has revealed himself to be a part, while, on the other hand, if it is one of the inalienable attributes of divinity to be parked quite out of contact with the phenomenal world, somewhere in inter-stellar space (Epicurus's hypothetical *intermundia*), then it follows inevitably that the gods cannot either affect or be affected by mundane affairs. The difficulty that is encountered by a would-be observer is, in fact, inherent in the nature of the genus of which the activities of observation and creation are two species. Both these kinds of activity are relations, and every relation sets up a mutual disturbance of the parties to it.

For a would-be observer of the phenomenal world this difficulty is aggravated by one of the World's apparent characteristics. Phenomena have the appearance of being on the move through time and space; and, since the observer himself is one of these apparently travelling phenomena that he is surveying, he must do his intellectual work in a fellow traveller's never stationary driving-seat. For example, in the astronomical province of the mental field in which the general object of study is the physical cosmos, human observers are at present confined to the surface of one of the travelling stars; and our astronomers will not find themselves in any better position for taking their observations if they manage, one day, to make their way to the Moon or to Mars or to some planet in another solar system than ours or even in another galaxy. As athletes, they will have been as clever as Baron Munchhausen was when he jumped off the cannon's mouth on to the cannon-ball that had just come whizzing out of it, and when he then changed cannon-ball mounts in mid-air. But like the Baron the astronomers will still be travelling inside the realm of time and space whose physical phenomena they are studying, and the relativity of their own physical track through time and space to the tracks of the heavenly bodies that they are observing will still be affecting their scientific findings. It must, indeed, be affecting these at each successive configuration of the perpetually changing network woven by the respective space-time points through which each of the heavenly bodies, including the observer's own vehicle,

is passing. It was a marvellous feat of intellectual imagination to realize that the actual astronomical observer, being imprisoned in space and time, could never take observations from the illusory vantage-point of an hypothetical observer inconceivably posted outside them. But thanks to Einstein's genius the point is now obvious to ordinary minds. It should be still more obvious when the phenomena that we are trying to observe are not the movements of the stars but are human affairs.

In this field of observation it is surely manifest that the observer himself is being carried, all the time, farther down the stream whose upper reaches he is attempting to survey from the crow's-nest on his travelling mast-head. The past course of the river of human history does not shift its bed. When once events have happened, they remain unchanged in fact. But they keep on changing their appearance because there are unceasing changes in the observer's own momentary position, which is the only position from which he can ever look back at the past.¹

'In the sciences of Man, the rational core, common to all science, is diminished, obscured, and distorted by the inevitably partial perspective of the observer.'²

This is why, for the last two hundred years or so, each successive generation of modern Western historians has rewritten the history of the Hellenic World. The facts of Greek and Roman history have remained, throughout, what they always were, and our information about these

¹ 'The history of history eludes historical inquiry (*Die Geschichte der Geschichte entsteht sich der Historie*). There can be no scientific pronouncement about the whence and whither of history. One has to be inside history for any such question to be possible.' The sense of freedom comes from a conscious questioning of the past and the future, and this presupposes that human souls, as we know them, are already in existence (K. D. Erdmann in *Archiv für Kulturgeschichte*, xxxiii. Band, Heft 2 (1951), pp. 237 and 240). The historian is an observer who stands inside the framework of the events that he describes (K. W. Thompson in *The Political Science Quarterly*, vol. lxxi, No. 3 (September, 1956), p. 367). 'The meaning of the past is seen in the present, and, as the present changes, so does the meaning that we see in the past' (Social Science Research Council's Committee on Historiography's Report (1954), p. 23). This last point is also made by Bagby in *Culture and History*, p. 41.

² H. J. Morgenthau in *Toynbee and History*, p. 193. In the same context, Morgenthau points out that 'scientific' history is 'unproblematic in detail but a problem in its very conception of history'. It is, he suggests, an epistemological impossibility to study one civilization objectively from an observation-post in another civilization. If Burckhardt's idea of history is right, 'the great achievement of Mr. Toynbee as a historian lies in that very subjectivity that is the horror of scientific historiography'.

The would-be scientific and objective historians have, it would seem, been caught in a trap. Their pursuit of scientific objectivity has led them, as we have seen, to insist on the uniqueness of the human phenomena that they are studying. But, as Erdmann points out, a belief in the uniqueness of individuality implies a denial of the belief in the uniformity of human nature, and this denial, in its turn, leads to an affirmation of relativity that applies to the personality of the historian himself. 'Historiography becomes its own subject-matter (*Die Geschichtsschreibung wird sich selbst zum Gegenstand*)'—as it has become for Gooch and Butterfield and Collingwood, for instance. 'Historicism' (*Historismus*) and 'existential' philosophy are expressions of the same intellectual process in two different provinces of study' (K. D. Erdmann in *Archiv für Kulturgeschichte*, xxxiii. Band, Heft 2 (1951), pp. 178–81).

In the same article (on p. 182) Erdmann remarks that the naïveté of my approach to history has saved me from inhibiting myself by 'ruminating in a broad way about the "ifs" and the "buts" of the [epistemological] problems involved in an undertaking like' mine. I admit to the naïveté of my first approach, and I agree with Erdmann's ironical comment that it gave me the hardihood to rush in where a philosophically sophisticated angel might have feared to tread. Now that my naïveté has allowed me to produce ten volumes, I can afford, in the present volume, to let myself consider the epistemological problem of relativity.

facts has not changed to anything like the extent that would be required if this change in our modern Western knowledge of the facts was to be taken as explaining the successive changes in the appearance of these facts to our modern Western eyes. There have been no losses of knowledge; we have preserved all our previous knowledge intact; and, in spite of our archaeologists' magnificent achievements in bringing to light buried buildings, works of art and technology, and inscriptions, the consequent additions to our knowledge have not been very great—at any rate not great enough to account for the continual changes in our view of Hellenic history. The changes in the appearance of the picture have been brought about, not by changes in the historical facts or in our knowledge of them, but by successive changes in the position of the modern observer. The only light that we can throw on the past is the light of our own experience. Any historian will inevitably be living and working in a particular social milieu at a particular stage of its development, and his own situation will make him sensitive to some features in a past situation and blind to others. In recent centuries our experience in the West has been changing, from one generation to another, sufficiently to produce appreciable changes in the distribution of our sensitive spots and our blind spots. Nineteenth-century Western students of Hellenic history were sensitive, for instance, to the constitutional aspect of Greek and Roman political life, and particularly to manifestations of democracy; their twentieth-century successor's eye is caught by the economic facet of Greek and Roman life and by manifestations of bureaucracy and dictatorship. Different features of an unchanging landscape appear to be the salient features in each successive generation. In each case these things that seem to stand out from the rest are things whose significance has been brought home to the historian by his own experience in his own day.¹

Westerners of the present generation feel that, in these recent centuries, the Western way of life has been changing at a pace that has been accelerating until it has now become uncomfortably fast. Yet the West has been singular, and fortunate, in having been free to move at its own pace. No outsiders have been setting its pace for it. In contrast to the Western peoples, all other peoples in the World have been having their pace set for them, during these same recent centuries, by the West. They have been having to try to catch up with the West in the field of the West's own special achievements in order to hold their own against the West. So in recent times the non-Western World's pace,

¹ This point has been well taken by Bagby, 'Every human activity must find its origin in present human needs' (op. cit., p. 48). 'Each generation must find its own interpreters, the historians who will show how the past can be related to the new needs and problems of the day' (ibid., p. 49). In other words, 'all true history is contemporary history' (B. Croce: *Teoria e Storia della Storiografia* (Bari 1917, Laterza), p. 4). F. A. Hayek, too, holds that 'we . . . study particular events because they have contributed to create the particular environment in which we live, or because they are part of that environment' (*The Counter-Revolution of Science*, p. 70). At the same time, Hayek rightly contests the doctrine that all historical knowledge is necessarily relative. 'The kernel of truth in the assertion about the relativity of historical knowledge is that historians will at different times be interested in different objects, but not that they will necessarily hold different views about the same object' (op. cit., p. 70). Yet, though this is not inevitable, it can happen and has, in fact, happened frequently.

by comparison with the West's pace, has been revolutionary. This means, among other things, that in our day a Russian or a Muslim or a Hindu or a Chinese or a Japanese has been having to make far more drastic revisions of his view of the past—particularly his own society's past—than any that a Westerner has had to make in his view of the Hellenic past. The facts of Russian, Muslim, Indian, and East Asian history have not changed, any more than the facts of Hellenic history have changed. But the modern African or Asian or Russian observer has had to move still faster and farther, between one generation and another, than the contemporary Western observer has.

This inherent relativity of the historical kind of observation has been brought to our attention by the world-wide acceleration of the pace of social and cultural change in the current age. But this is not the first instance within our knowledge. We know of previous revolutions that have produced comparable changes between the pre-revolutionary and the post-revolutionary view of the past. After the 'epoch-making' overthrow of the Achaemenian Empire by Alexander the Great and the consequent incorporation of Egypt and South-West Asia in the Hellenic World, Hellenic historians—for example, Polybius and Diodorus among those whose works have partially survived—looked back on the pre-Alexandrine age of Hellenic history with different eyes from Thucydides' or even Herodotus's. Herodotus had a lively curiosity about the ways of life in the regions that Alexander was subsequently to bring under Hellenic domination, but the pre-conquest and post-conquest Hellenic pictures of these non-Hellenic civilizations were not the same. After a subsequent religious revolution in the Hellenic World, Hellenic converts to Christianity conflated the traditional Hellenic picture of world history, as presented in the works of pre-Christian post-Alexandrine Hellenic historians, with the traditional Jewish picture of world history, as presented in the Jewish holy scriptures, which the Christian Church had incorporated in its Bible, and they transformed both these pictures not only by conflating them but also by reinterpreting them in terms of the Christian conception of God's plan leading from the Creation to the Last Things. After yet another religious revolution of comparable magnitude, Christian and Zoroastrian converts to Islam similarly reinterpreted in Islamic terms the traditional picture of pre-Islamic history that they had inherited from their non-Muslim forebears. At the present day we can watch converts to Communism at work on reinterpreting in Marxian terms the traditional pictures of past history that have hitherto held the field in the West and in the domains of the other living civilizations.

These kaleidoscopic changes in the appearance of the past illustrate the problem of relativity which besets historians, anthropologists, sociologists, economists, and other students of human affairs—not least, perhaps, the psychologists. It is the same problem that besets astronomers, physicists, and other students of non-human nature. Whatever the nature of the object that is under observation, a human observer is incapable of seeing it with the imaginary detachment of an inconceivable outsider. If his study is physical science, he can see the

physical cosmos only with the eye of one mobile human participant in an apparent network of physical events that is perpetually changing its configuration in time-space. If he is a student of human affairs, he can see these only as a perpetually unfolding human drama. In every case his view of the past will be conditioned by the ever-changing position of his own present observation-point. Relativity is a limitation that is imposed on human studies in all fields by the very nature of the situation in which a conscious human mind finds itself; and it is a situation from which there is no escape.

In this matter of relativity the student of human affairs is in the same boat as the student of non-human nature; but the boat is partitioned by a bulkhead, and, on the humanist's¹ side of this, there are two holes in the boat's hull, not just one. Like the physicist, the humanist has the problem of relativity to cope with, but he has also to cope with the problem of bias; and from this the physicist seems to be exempt.

The physicist has to contend with the difficulty that the measurements which he registers of objects, events, or relations between objects or events in the physical cosmos will vary according to the speed with which he and his measuring-instrument are approaching towards, or receding from, the thing that he is trying to measure. This fluctuation that complicates the physicist's work is a mental occurrence, but it occurs only at the observational and interpretative level, that is to say at the intellectual level. The unavoidable play of relativity makes the physical objects of his study intellectually elusive for the physicist, as it also makes human affairs elusive for the humanist. But the physical scientist does not also have to contend, as the student of human affairs does, with discriminatory judgements of value and with partisan reactions of feeling for or against the objects of his study. In the physical scientist's field the objects are non-human, even when they are not inanimate, and this means that, in the psyche of a human student of them, they do not evoke 'affective' feelings or value judgements. The physical scientist is unlikely to catch himself admiring or loving this or that nebula, solar system, molecule, atom, or electron and despising or hating this or that other one. It requires quite a feat of scientific engineering to bring a remote nebula or even a close-up electron within the field of the observer's perception. Any specimen is welcome grist to his intellectual mill; but all specimens leave him emotionally and morally indifferent. On the level of feeling and valuation they are all one to him. By contrast, the student of human affairs has an ethical and emotional problem

¹ The word 'humanist' is used in this volume in its literal meaning of a 'student of human affairs', without the implication, which it sometimes carries, of a belief, in the humanist's mind, that human affairs can and ought to be studied in exclusively human terms, without taking account of religious beliefs in the existence and intervention of a spiritual presence or presences higher than Man. To describe this point of view, I shall be using the words 'rationalism' and 'rationalist'. Of course, a humanist can be a rationalist as well, just as a 'Germanist'—the German term for a student of Teutonic antiquities—can also be a holder of the belief that the Teutons are 'the master race' (*Herrenvolk*). The Germans' English fellow Teutons find this German belief quaint (though some English people actually hold it with an un-German unselfconsciousness). But if Teutonolatry is ridiculous, can anthropolatry escape the same charge? Does the notion of a *Herrenvolk* become any less fantastic when it is extended to the human race at large instead of being confined to the Teutonic fraction of it?

as well as an intellectual one to contend with. The objects of his study are human beings of like passions with himself. And it is impossible for one human being to think about another human being, present or absent, living or dead, without also having feelings about him and passing judgements on him. He either likes him or dislikes him; regards him as being either beneficent or maleficent; feels him to be either a friend or an enemy; judges his actions to have been either right or wrong; and appraises his character as being either good or bad, either righteous or wicked.¹

We may say with our lips that, when we are making an historical study of our fellow human beings, we suspend our moral judgements and suppress our feelings; but, if we fancy that we can do that, we are deceiving ourselves.² 'All interpretations of human events which profess to

¹ *Ad hominem*, the Rev. E. R. Hardy Jr. notes that my 'historical and ethical judgements interlock. He is sure, for instance, that earthly militancy ruins a religion. As moral theologian he is sure that it ought to, and as historian he notes that it usually has' (*The Intent of Toynbee's History: A Cooperative Appraisal*). T. A. Sumberg observes that, 'by . . . yielding to the pressure of his personal predilections, Toynbee makes his reader acutely aware of how time and space limit a historian's vision—a fact which he laments so audibly with respect to other historians' (*Social Research*, vol. 14, No. 3 (September, 1947), pp. 267–84). F. Borkenau, too, criticizes me for moralizing ('in *Commentary*, May, 1955, pp. 241–2). A. L. Kroeber finds my mind old-fashioned 'in founding its system of the ultimate interpretation of human history on explanations through character and morals. Therefore the distinctive and differential qualities of his civilizations are largely missed or ignored' (*Style and Civilizations*, p. 127).

On the other hand, Father M. C. D'Arcy draws the distinction that I have drawn above. 'In science the subject matter does not call for moral judgment, and the emotions of the scientist are not engaged. But the subject matter of history is human conduct. Moreover, the historian cannot divest himself entirely of his feelings and beliefs; and, if he were to try to do so, he would blind himself to what is the nature of human action' (*The Sense of History*, p. 167).

Robert Redfield, too, holds that we cannot study human conduct without placing values on it (*The Primitive World and its Transformations*, pp. 139–41). 'It is easy enough to be objective towards objects; but the human individual refuses to be only an object. When he is there before you, he insists on being judged as human beings are judged in life, if not in science' (*ibid.*, p. 152). Redfield's view is derived from his own experience as a field anthropologist. 'In the very necessity to describe the native, one must feel for him—or perhaps against him. The feelings are mixed with valuations. In Indian communities in which I have worked, I have found myself constantly liking and disliking some people as compared with others, and some aspects of the total culture as compared with others. . . . Objectivity . . . requires me to become aware of the values I have that may lead me in one direction rather than another. . . . But I do not think that it asks me that I divest myself of the human qualities, including valuing. I could not do my work without them' (*ibid.*, p. 154). 'In me, man and anthropologist do not separate themselves sharply' (*ibid.*, p. 165).

On this point, M. C. Swabey takes the same view as Father D'Arcy and Robert Redfield. 'To a far greater extent than in science . . . the historian's compilation of facts reflects the social background and preferences of the compiler. Not only is he, like the scientist, part of the physical world, but in a far more intimate way he is part of a particular society' (*The Judgment of History*, p. 233). 'In a sense, history is always concerned with the preservation of values. . . . Everywhere scales of preference and importance are woven into its accounts' (*ibid.*, p. 55). The role that is characteristic of the historian is the judicial one (*ibid.*, p. 238). In Swabey's view, however, valuation is an inseparable concomitant of study even where the object of study is non-human nature. She pillories 'the falsity of trying to exclude values from the method and content of knowledge' (*ibid.*, p. 241). 'Valuation . . . is omnipresent in experience. . . . All alleged knowledge (not excepting the scientific) is essentially evaluative. . . . Acceptance of a framework of values as authentic presuppositions is the condition of natural knowledge' (*ibid.*, p. 250).

² 'The approach to history which will be advocated here is essentially aesthetic rather than moral. It involves a sympathy with things as they are, rather than as they ought to be. It is the point of view of the scientist or the saint as opposed to that of the political or religious reformer' (P. Bagby: *Culture and History*, p. 48). In the present writer's judgement, Bagby usually fails to live up to this claim when he touches on the subject of

exclude ethics actually smuggle in uncritical ethical judgments.¹ Feelings and judgements are inherent in all relations between one human being and another.² This is, of course, generally recognized in the case of relations that are competitive: e.g. personal rivalries, business competition, litigation, political contests, war. Perhaps there is an element of competition in all the relations of practical life. But it may be asked whether it is really impossible to be unemotional and uncensorious in one's attitude towards one's fellow human beings when one's relation towards them takes the form, not of action, but of study. Is not this a relation in which the observer's personal interests are not engaged, even if the people whom he is studying are his living contemporaries? *A fortiori*, if they are now dead, and have been dead for hundreds or thousands of years, cannot the historian study them with the emotional and ethical indifference that comes so easy to the physicist in his study of his electrons and his galaxies?³ This question is answered in the

religion. In these passages there is an animus showing through a cloak of irony; Bagby has not really got rid of the religious reformer in himself; he has turned him inside out, but he is still transparently the Old Adam.

The approach attempted by Bagby is also proposed by G. A. Birks in a letter to me of 23rd January, 1949. He suggests 'eliminating all values' on the ground 'that they are irrelevant in any connexion in any scientific inquiry, and harmful both to the pursuit of truth and to its acceptance. Other sciences have found it difficult to eliminate them, but have found new vitality after doing so: e.g. chemistry (long preoccupied with the "precious" metals) and astronomy (with its former bias towards "perfect" circular motion).' It is undoubtedly true that, in the study of non-human affairs, the introduction of human values is out of place and that there is everything to be gained by getting rid of this incongruous and confusing importation. But it does not follow that human values can similarly be eliminated from the study of human affairs. In my belief the suggested analogy of the sciences dealing with non-human nature does not hold good on this point.

However, Trinkaus has criticized me on the ground that I have achieved what appears to me to be Bagby's aim. According to Trinkaus, the comparative method of study that I have followed has broadened the view of history, but this at the cost of taking the element of value and purpose out of our view of ourselves (*Science and History*, vol. xii, No. 1 (1948), p. 221). This judgement seems hardly compatible with Sumberg's cited on p. 54 in footnote 1. One of the two must surely be mistaken. I myself agree with Sumberg.

¹ M. R. Cohen: *The Meaning of Human History*, p. 287.

² Frederick Schuman is recognizing this truth when he commends me (in *The Nation*, 6th November, 1954) for 'boldly making judgments and seeking no refuge in specious detachment'.

³ Sorokin seems to imply that we can achieve this scientific detachment in studying human affairs, for he criticizes my account of the rises and falls of civilizations on the ground that I have presented evaluative formulae of progress and regress but not true formulae of change (P. A. Sorokin in *Toynbee and History*, p. 180. Cp. p. 183). Yet it is not easy to find formulae of change that do not carry connotations of value. In my series of four terms—'genesis', 'growth', 'breakdown', 'disintegration'—the last three, at any rate, obviously imply that the changes described by them involve gains or losses in value. In applying this scheme to Egyptian history, I applied my term 'breakdown' to the stage in which 'the Old Kingdom' went to pieces, and my term 'disintegration' to all that followed after—labelling 'the Middle Empire' and 'the New Empire' as 'rallies' which temporarily arrested the process of 'disintegration' but did not ultimately reverse it. This application of my scheme has been courteously but firmly rejected by J. A. Wilson in *The Burden of Egypt* (Chicago 1951, University of Chicago Press), p. 32, footnote 12. Wilson is one of the foremost living authorities on the Egyptian Civilization, and, in the light of his criticisms and others, I have reconsidered and revised, in the present volume, my previous view of the structure of Egyptian history. At the same time, I find that Wilson's own picture of this resembles mine in carrying with it connotations of value. In Wilson's morphology of Egyptian history, the two periods of political disunity between 'the Old Kingdom' and 'the Middle Empire' and between 'the Middle Empire' and 'the New Empire' are labelled respectively 'the First Intermediate Period' and 'the Second Intermediate Period'. These labels are, of course, correct in the sense that these two periods of political disunity were in truth intermediate between three periods of political unity. But it is equally true that those three periods of political unity were intermediate

negative by the evidence of a classical test case in which the conditions have been as favourable to the possibility of indifference as they could ever conceivably be. It is also answered in the negative by a consideration of the nature of Man and the consequent nature of relations between human beings.

This identical finding of deductive reasoning and empirical observation cannot, I believe, be gainsaid. But, if it cannot, that is not the last word; it is an indication that we are face to face with a problem that we can neither evade nor ignore. If we come to the conclusion that feelings and judgements cannot be eliminated from human relations, even when these take the relatively anodyne form of a scholar's academic exercise, this does not constrain us also to conclude that there are no steps that we can and ought to take for coping with this particularly awkward feature of the human situation. There are possible steps that can be at any rate partially effective; and we must consider these, with the earnest intention of taking them. But we shall be in a better position to do this when we have fully faced the difficulty of the task.

Let us examine, as our test case, whether it has actually proved possible to be emotionally and ethically indifferent when one is studying, and writing about, some controversial personality. Let us rule out the living: Mr. Khrushchév, for instance, and Mr. Nixon and Pandit Nehru and Colonel Gamāl 'Abd-al-Nāsir. The negative answer to our question would be obtained too easily on these tests. Let us also rule out the recently dead: John Foster Dulles, for instance, and Franklin D. Roosevelt, Stalin, and Hitler. These personalities still arouse the feelings and evoke the judgements that they aroused and evoked in their lifetimes. Let us even rule out controversial figures that have been dead now for some time, but whose souls go marching on: such posthumously potent personalities as John Brown and Karl Marx and Calvin and Luther. Let us take the Egyptian Pharaoh Ikhnaton, who lived and died in the fourteenth century B.C., and let us remind ourselves of his extraordinary history.

Ikhnaton stood for a revolution² in every important sphere of cultural and spiritual life: in literature, in art, and, above all, in religion. This made him an acutely controversial figure in his lifetime; and, when his opponents regained the upper hand after his death, they vented their hatred of him by chiselling out his name from his inscriptions and

between four periods of political disunity. Thus it would have been equally logical to label the periods of unity 'intermediate', and to call the periods of disunity by some descriptive name: let us say, 'periods of local liberty'. Why has Wilson chosen to call these periods of local liberty 'intermediate' and given descriptive names to the intervening periods in which local liberty was restricted or even suppressed? Surely his terminology has been determined by an unspoken value-judgement. Wilson evidently thinks of the periods of political unity as being the 'great' periods of Egyptian history, and thinks of the periods of political disunity as being temporary lapses from the ideal.

² It is best to use this form of words, because it avoids begging the question whether Ikhnaton was the real author and initiator of the revolution associated with his name and his reign, or whether he was a stalking-horse, figure-head, or puppet who was manipulated and exploited by other people. The evidence for answering this question with certainty may never come into our hands. But it is certain that Ikhnaton became the symbol of the revolution in the minds of both his collaborators and his opponents, and this undisputed fact is all that is needed to make his history a relevant test case for our present purpose.

by blackening his memory. Ikhnaton was remembered vividly in his own world as an arch-criminal so long as the Egyptiac Civilization lasted. But it did not last for more than about sixteen hundred years after Ikhnaton's death. In and after the third century of the Christian Era, people in Egypt began to forget how to write and read any of their traditional scripts. The memory of the whole history of Pharaonic Egypt was almost entirely lost; and, for the next sixteen hundred years, there was no one alive in the World who knew that such a person as the once notorious Ikhnaton had ever existed. Then, in the nineteenth century, modern Western scholars deciphered the Egyptiac scripts, and in the eighteen-eighties they dug up Ikhnaton's archives and published them. So, after having been buried in oblivion for sixteen centuries, Ikhnaton became notorious again; and, as soon as this happened, the challenging personality that he had been, or at any rate had been taken to be by his contemporaries, quickly aroused something of the same passion, for him and against him, among modern scholars in Western countries as it had aroused in his lifetime in Egypt.

This example—and it is only one of a number that could be cited—shows that the problem presented to students of human affairs by feelings and judgements is not a problem that is solved automatically by the mere passage of time. We do not find it surprising that a challenging personality like Franklin D. Roosevelt's should still be arousing passionate feelings when the hero or villain has been dead for no more than sixteen years. But, if we assume that such feelings were then still haunting his memory simply because he had been in the land of the living so recently, we are not facing the problem of bias squarely. The case of Ikhnaton indicates that this problem will always dog the historian, however remote in time and place the human object of his study may be.

But we do not have to depend on an induction from historical evidence to convince us that, in the study of human affairs, the elimination of feelings and judgements is impracticable. The cogent proof of this proposition lies in the consideration that, if we did succeed in making ourselves emotionally and morally indifferent to a human being whom we were studying, we should have thereby made it impossible for us to go on studying him as a human being. To be human means being morally responsible and therefore responsive to moral judgements—other people's judgements and one's own judgements—about oneself. It also means being emotionally sensitive to feelings about oneself—one's own feelings and other people's. However exasperating or crushing other people's feelings and judgements about oneself may be, it is not so painful to have to bear them as it would be desolating to be relieved of them; for, however hostile and unfavourable they may be, they are certificates that one is still being regarded as human by one's fellow human beings; and, so long as one really is human, life would be intolerable if these certificates of one's humanity were to be withdrawn.

Human beings smile when they see a dog vindictively break his teeth on a stone against which he has stubbed his toe. Only a poor brute beast, we reflect, would be so irrational as to mistake an inanimate object for a responsible agent who could be taught a lesson or at least be

made to pay for his offence. Xerxes has earned undying derision by his canine folly in flogging the waters of the Dardanelles as a punishment for their having carried away his bridges. Such childishness, we feel, is beneath a grown-up human being's dignity. Human adults do not bite stones or flog waves. And, if they are attacked by a non-human living creature—a shark, say, or a man-eating tiger, or a bacillus—they do not feel the anger and indignation that they would feel if they were being attacked by a human assailant. They just try to save their lives, as they would if they were being imperilled by a fire or a shipwreck or an avalanche. Again, they do not think it reasonable to resent or condemn the behaviour of a fellow human being who has gone out of his mind or become senile, and they feel that allowances ought to be made for infants and invalids.

These attitudes are rational and humane, but they are not complimentary. They imply a recognition that the fellow human being who benefits by them has permanently or temporarily lost, or has not yet gained, the priceless gift of being completely human. As the invalid recovers and the infant grows up, the indulgence granted to them is progressively withdrawn, and its withdrawal is not an act of inhumanity; on the contrary, it is the recognition of the recovery or attainment of full human moral stature, with its corollary, full human moral responsibility. The spectacles of lunacy and dotage are harrowing because here there is no expectation of recovery; and, for human beings, the continuance of mere physical life without human rationality and responsibility is a fate far worse than physical death. Perhaps I have now demonstrated my thesis that complete emotional and moral indifference towards a human object of study would enable this study to become entirely objective at the cost of making it utterly impossible. It would mean that the object of study had ceased to be human in the student's eye, and this, in turn, would mean that there was no longer a human relation between the two parties. If, on these terms of emotional and moral indifference, the study could continue at all, it could only be on the basis of treating the object of study as an automaton, and this would surely deprive the study of all further significance and value.

How, then, are we to cope with our feelings and judgements about human beings whom we are trying to study, when we have faced the truth that we cannot cope with feelings and judgements by eliminating them? Clearly we cannot be content just to take note of this question without trying to find an answer to it. We must try, because these feelings and judgements that it is impossible to eliminate are not, on that account, necessarily justifiable. Perhaps they might be if the rationality that gives dignity to human nature were complete and all-pervasive. Unhappily, as we well know, rationality is only one facet of a human psyche; another of its facets is its self-centredness, and this is a vice which is capable of vitiating any feelings and judgements and which therefore renders all feelings and judgements suspect.

For example, a person's feelings and judgements about another person with whom he happens to be in competition or in conflict are rightly suspect in the eyes of everyone else, and also in the eyes of the

person who is experiencing the feelings and making the judgements, if he has any capacity at all for introspection and reflection. It is a sound working rule to presume, unless and until convincing evidence has been produced to the contrary, that a human being is self-centredly prejudiced in his own favour. But self-centredness in the singular is not the only form of the vice. There is also self-centredness in the plural.¹ In Arabic there is a word for it: *nahnayah*, which, in Western languages that draw on Latin to extend their vocabularies, can be translated literally by coining the word 'nosism', as a plural for the singular word 'egotism' which is already well established. Self-centredness is perhaps even more difficult to cope with in its plural form than it is in the singular, because in the plural it is both more insidious and more potent.

It is more insidious because, when a human being is acting self-centredly, not solely on his individual account, but in the name of his family, parish, nation, state, or church, he can delude himself into imagining that he is acting on behalf of something that is not only greater than himself but is outside himself, and that therefore he is acting altruistically and even self-sacrificingly—as, for instance, when he risks, and perhaps loses, his life by serving his country as a soldier. In reality, of course, when I have expanded my singular 'me' into our plural 'us', my singular is still contained in our plural. The act of changing the grammatical number of my self-centredness has not disengaged me from it; it has actually made it more difficult for me to cope with by giving me a plausible ground for imagining that I have disengaged myself from it, though I have not.

Self-centredness is also far more dangerous in the plural than it is in the singular. Someone who is pursuing his singular self-interest may be checked by a guilty conscience and a sense of shame in himself, even before he draws on himself the disapproval and opposition of his neighbours, who, collectively, are likely to be able and eager to keep him within bounds. Someone who is pursuing a plural self-interest will be more prone to feel self-righteous; he will also have collaborators whose fellow feelings will confirm his confidence in the righteousness of his cause; and the collective power that he and they can jointly apply for putting their self-centred aim into action will be immeasurably stronger than the power of each of them acting individually.

If it were conceivable that Man's pre-human ancestors could have become fully human without having become social beings in the process, a completely human but at the same time utterly solitary individual would be one of the weakest of living creatures, because, in isolation, he would not be able to take much advantage of the potentialities of power latent in the freedom and the grasp of his hands, in the stereoscopic vision of his co-ordinated pair of eyes, and in the intelligence of his exquisitely organized brain. Robinson Crusoe managed to bring

¹ This important point has been well taken by M. C. Swabey. 'Egoism . . . is by no means lacking in social scope, since a man's self-interest tends to be as wide as the circle on which he depends' (*The Judgment of History*, p. 230). 'Social consciousness is never free from self-love, and experience plainly shows how a man may be "socialised" in the service of a group without at all relinquishing self-love as his supreme value. . . . A great gulf separates our fellow-feeling for the existent members of our society from respect for the dignity of Man' (*ibid.*, p. 142).

ashore with him, out of the wreck, a fair sample of the material equipment that was the cumulative product of human co-operative enterprise up to date, and he also inherited the accumulated knowledge of the use of such tools as he had. Thus, even when marooned on his island, he was by no means isolated in reality; he was isolated only in the present; he still shared in the common heritage from the past. Yet, even so, he was constantly finding that the absence of present companions set disconcerting limits to his power—as, for instance, when he had used his tools and his skill successfully to build a big boat in the well-timbered interior of his island, without having remembered that it would need the muscle-power of more human beings than one to move the completed boat down to the water's edge.

Co-operation enormously increases the possibility of turning to account Man's potentialities for exerting power. Accordingly, a human being's self-centred pursuit of self-interest can be far more effective, besides being likely to be less conscience-stricken and therefore less hesitant, when the first person of the active verb is in the plural number. This consideration applies to relations of all kinds between human beings: to the study of human affairs no less than to the so-called practical kinds of human social activity. This point is particularly pertinent to our present inquiry, because so large a part of the study of human affairs is concerned with Man in the plural, not in the singular.

How are we to deal with these feelings and judgements that always assert themselves in us when we are studying human affairs, however apparently remote these may be from ourselves and from our own interests? We cannot afford not to do battle with our self-centredness in both the singular and the plural. The degree to which we succeed in extricating ourselves from it gives the measure of the level of our knowledge and understanding of a universe which, in reality, does not centre on us.¹ The first step is to try to drag our feelings and judgements up into the full light of our consciousness and to try to see them as they are.² The effort demanded by this undertaking is a moral as well as an intellectual one. Unless we can bear self-mortification, we shall not be able to carry self-examination to the necessary painful lengths. Without humility there can be no illuminating self-knowledge. In fact the moral and the intellectual effort must go hand in hand, and, in both aspects, the enterprise is difficult and strenuous. However able, open-minded,

¹ See M. C. Swabey: *The Judgment of History*, pp. 5-6.

² The need for such self-examination has been widely recognized. See, for instance, the passage quoted on p. 20 from K. R. Popper's *The Poverty of Historicism*, p. 152. 'A perfect objectivity is, no doubt, impossible, but it must always be our goal, and we should do well to become fully conscious of our individual biases in order to be able to discount them ourselves and to help others to do so' (Bagby, op. cit., p. 4). 'The safeguard against bias is not to indulge in useless resolutions to be free from bias but rather to explore one's pre-conceptions, to make them explicit, to consider their alternatives, and thus to multiply the number of hypotheses available for the apprehension of historical significance' (Cohen, op. cit., p. 80. Cp. p. 115). 'The need for awareness of bias . . . rests on the widely accepted psychological theory that selectivity in the individual's response to any stimulus is unavoidable. The remedy proposed by psychologists is not to strive to eliminate the element of selectivity, not to assume that by careful attention one can become an objective recording machine, but rather to define the basis for selection' (Social Science Research Council's Committee on Historiography's Report (1954), p. 85).

and humble-hearted an inquirer may be in analysing himself, many of his fundamental prejudices—and these are the most warping prejudices of all—are likely to escape detection, just because they are buried at so deep a level of the subconscious abyss of the psyche. There are limits to a human being's ability to read the secrets of his own heart, however sincerely and valiantly he tries. So the enterprise of self-examination can never be carried through to complete success. This, however, is no argument for refraining from making the attempt; for it is not a case of all or nothing. Even the smallest advance in self-knowledge is so much to the good.

In any inquiry it is wise to make one's approach by starting from what is least obscure. On this principle the most promising starting-point for an attempt to examine oneself would be to consider how one's outlook has been affected by one's education. The word 'education' should, of course, be construed in a broad enough sense to include, not just formal schooling, but the whole influence of one's total social and cultural environment since one's birth: the civilization, country, parish, and family into which one happens to have been born; one's mother-tongue;¹ one's parents' religion, social class, and profession; one's personal education, in the narrower sense of the word,² and profession in after life; and the extent of one's acquaintance with other social and cultural milieux besides the one in which one has been brought up. One would then have to consider one's reactions to these divers influences. Has one accepted them unquestioningly and uncritically, or has one welcomed them enthusiastically, or has one resisted them, even to the extent of 'leaning over backwards' in a determination not to be governed by them? At this point one would be trying to observe the interaction between education and innate temperament. This interaction is so constant and so intense that it is not easy to distinguish and disentangle the two factors. As far as one could succeed in doing this, one would be able to insulate one's temperament and analyse it. This would obviously be the most difficult part of the inquiry. These psychological phenomena are obscure in themselves, and they concern the inquirer so intimately that, even if he were trying bona fide to bring them to light, he might misinterpret them unintentionally.

A self-survey on some such lines, however inadequate, would be likely to suggest several useful reflections. It would immediately make one aware of the relativity of one's outlook to one's temperament and one's environment. One's temperament is the product of a particular combination of genes from one's parents' respective genetic heritages. The number of alternative possible combinations was very great, and each one of them would have produced a different temperament from that with which one happens to have been endowed by Nature's

¹ Bagby points out that 'our own ideas and values are embodied in our language, and yet our language is the only tool we have with which to describe alien ideas and values' (*Culture and History*, p. 191).

² If one has had the 'classical' education that, in most of the civilizations, has been the usual form of higher education till quite recently, one would have to take account of the effect of an acquired classical language or languages on one's ideas and values, besides the effect of one's mother-tongue. On this, see further the Annex, *Ad Hominem*, to Chapter II, pp. 575-605.

mathematical game of permutations and combinations. One's actual temperament, which is the foundation of one's personality, has been allotted to one casually by a biological mechanism which, from the human product's standpoint, is a blind throw of the dice; and it has been singled out of a host of various possibilities ranging, perhaps, over most of the gamut of Theophrastus's characters and Jung's psychological types.

The allotment to one of one's social and cultural environment might, at first sight, seem less capricious. A child is the offspring of parents who must have been living in some particular environment at the time when the embryo was conceived; and, since most children are brought up by their parents, most of them also grow up in their parents' environment as a matter of course. This, however, is merely normal without by any means being inevitable. In the grim age through which people of our generation have been living since A.D. 1914, there have been many children in the World who, in early infancy, have lost their parents and have grown up as orphans, waifs, and strays, in quite different social and cultural surroundings from those in which their parents brought them into the World. It is a well-known fact that these changelings have been moulded by the actual environment in which they have grown up to just the same extent as their contemporaries who have grown up in the same environment, not in consequence of a catastrophe, but for the normal reason that this was their parents' environment. The Russian-born child of Russian-born parents that has been transported in early infancy to Portugal, and has been brought up there without any subsequent contact with parents and native land, will speak Portuguese as if that were its 'mother-tongue' and will take it for granted that Roman Catholic Christianity is the only true and saving faith. Conversely, the Portuguese-born child of Portuguese parents that has been transported in early infancy to Russia and has been brought up there in insulation from its Portuguese origins will speak Russian as if that were its 'mother-tongue' and will take it just as much for granted that the true and saving faith is Communism.

When once one has realized that one's own standards, values, and outlook are the product of one's heredity and one's environment, and that they could and would have been different if a different heredity and environment had fallen to one's lot, it becomes impossible to maintain a child's naive assumption that its feelings are right, its judgements just, and its beliefs true in some absolute sense. This recognition of the relativity of any set of human standards and values—whether it is common to a group or is peculiar to an individual—should make one more distrustful and critical of one's own set and at the same time more charitable and open-minded towards the sets that we find in other people. This may lead one to try to examine alien outlooks, values, and standards as dispassionately as one will have tried to examine one's own in the first stage of the inquiry.¹ One will now inquire, as one will have

¹ Bagby, in *op. cit.*, p. 3, submits that 'our personal prejudices, even if expressed in the form of moral judgments, are poor guides to the understanding of anything whatsoever'. This dictum is true if, for the word 'whatsoever', we substitute the words 'except oneself'. If we can detect our personal prejudices and face them, they will give us a clue

inquired in one's own case, what the circumstances were in which these standards were acquired, and one will probably find that the circumstances explain the standards to us by revealing to us why they seem right and just and reasonable to the people whose standards they are.¹

Any such change of attitude towards ourselves, and consequently towards our fellow human beings too, would evidently make for an improvement in human relations of all kinds. When the relation is an intellectual one—a study of human affairs by a human mind—it would be true to say that a recognition of the implications of relativity is a prerequisite for achieving any results at all. 'Moralising is incompatible with historic insight.'² So long as one is taking one's own standards as an absolute norm to which other people's standards must measure up, one cannot begin to see these other people as they really are, or to appraise their standards at their real worth.³ This is evident when one is trying to make a comparative study of two or more persons other than oneself, or of two or more societies, cultures, or religions other to the distortions in our mental picture of phenomena, and this clue will give us a means for trying to see the picture in something more like the true perspective.

The same point is made by Bagby in *Toynbee and History*, p. 108. Bagby's contribution to this volume originally appeared in *The Times Literary Supplement* and was therefore published anonymously in accordance with the usual practice of the *T.L.S.* On the day of publication, Bagby himself told me, at a public meeting, that he was the writer of the article. So I am free to make it known that this article comes from the same hand as *Culture and History*.

¹ 'If one man wishes to understand and predict another's behaviour, he does not consider his own preferences; he tries rather, in the common phrase, "to look at things from the other man's point of view", to appreciate and sympathise with his likes and dislikes rather than to project his own' (Bagby, op. cit., p. 3). In another passage (*ibid.*, pp. 45-46), Bagby acutely discerns the limits of this possibility. 'We may be able to describe more or less objectively the behaviour or even the motives of others to which we are indifferent; if we wish to feel their emotions, we must inevitably project into them something of ourselves. For this reason, our knowledge of human beings in the past, and for that matter in the present, is necessarily limited. We are inevitably outsiders and must resign ourselves to that fact.' Bagby also points out, however, that our own mental processes, including our ways of feeling as well as our ways of thinking, do provide us with a 'model' for interpreting the mental processes of other people (*ibid.*, p. 66). It goes without saying that this 'model' which is derived from one's own picture of oneself must be used discriminately and cautiously if we are to avoid being misled by it.

² W. den Boer in *Toynbee and History*, p. 240. Cp. p. 242.

³ This point is perhaps easier to take when the intellectual and moral misdemeanour is being committed, not by oneself, but by someone else. We rightly feel that a trick has been played on us when we discover that the only surviving account of some dead person or extinct people presents them, not as they really were, but as they have been portrayed by some vocal third party who has 'made a corner' in the telling of the tale and has innocently or deliberately taken advantage of this opportunity to blacken the face of his dumb neighbour in the picture of him that he has handed down to posterity.

Two classic examples are the Athenian picture of the Boeotians and the Israelite picture of the Philistines that have been transmitted to the Western World and have given the words 'Philistine' and 'Boeotian' uncomplimentary connotations in modern Western languages. The Philistines seem to have little chance of redress. Our modern archaeologists have not yet succeeded in giving us much independent evidence about them to set against the ugly picture given in the Old Testament. The Boeotians—branded by the Athenians as 'Boeotian swine'—have managed to bequeath to us some telling evidence on their own behalf. Read Pindar's odes and Plutarch's biographical and philosophical essays, and look at a collection of graceful terracotta Tanagran figurines in some modern museum, and you will be astonished that, in the teeth of this evidence of the true nature of Boeotian culture, the Athenians should have succeeded in establishing their *fable convenue*. What the Athenian fable truly tells us is, not what the Boeotians were like, but what their enemies the Athenians wished us to believe about them.

Another example is the Achaeans' picture of the Aetolians, as painted in the surviving parts of Polybius's work. The Aetolians' case has gone by default. There is no surviving picture, either of the Aetolians themselves or of their Achaean rivals, from an Aetolian pen.

than one's own.¹ And there is a valid and pertinent sense in which all study of human affairs is comparative study, for implicitly the inquirer is, all the time, comparing his human objects of study with his human self, singular or plural. Open-mindedness, charity, and sympathy are not only signs of grace; they are priceless virtues. But, if one manages in some measure to acquire these virtues and to practise them, they lead one to the threshold of a problem for which they themselves do not provide any automatic solution. For it is not true that 'tout comprendre est tout pardonner'.

Suppose that one has now recognized the fallibility of one's belief in the absolute rightness of one's own standards and in the consequent absolute wrongness of other people's conflicting standards, one is confronted with Pilate's question, 'What is truth?' It is clear that the two conflicting sets of standards cannot both be absolutely right, but this is no proof that either of them is absolutely wrong, and all standards cannot be absolutely wrong; for if they were there would be no such thing as truth and therefore no possibility of judging between one set of standards and another. Indeed, it seems impossible, *ex hypothesi*, that any set of standards can be totally wrong if it is the actual guiding rule of a group of human beings, or even just of one solitary individual. However perverse it may look in the sight of the rest of mankind, they cannot judge it to be totally wrong without judging the people who live by it to be insane, or in other words non-human and therefore incapable of having any standards of a human kind. This must, it would seem, be so; for to lack any recognizable moral standard would be tantamount to lacking the sense of a distinction between right and wrong; and this sense is surely part of the essence of being human. A sane human person will still retain it, even if his standards strike other people as being preposterously wrong, and even if he deliberately and consciously violates his own standards, such as they are.

It will be seen that the recognition of the relativity of human outlooks, standards, and values raises a difficult question. When one has admitted that his own standards are relative, can he have any intellectual basis or moral standing for passing judgements on someone else's standards? Logic answers this question in the negative; but experience rules this negative answer out by pointing to the unquestionable fact that Man is a social being; for there could be no human society if human beings had no capacity and no right to pass judgements on each other and, what is more, to put their judgements into action—and we should be inhibited from doing either of these things if we did not believe, or rather take for granted, that our own standards represent, however imperfectly, a generally valid standard, common to us and to our fellow human beings. If we believed that our own standards represented nothing but personal caprice or, at the widest, tribal custom, we should not have the face to make and execute judgements on the strength of them. This is obvious in the field of practical affairs; a belief in the general validity of moral standards is one of the necessary conditions for social relations; but it is also a necessary condition in the field of study; for study too is action in

¹ See A. L. Kroeber: *The Nature of Culture*, p. 6.

a social setting.¹ It is true that we cannot study our fellow human beings' standards intelligently unless we recognize that these have a value of their own which we should be misrepresenting if we insisted on interpreting it in terms of ours. But it is also true that, if our recognition of the relativity of all sets of standards were to lead us to the conclusion that we are not entitled to pass judgements on any of them, we should be debarring ourselves from making any study of human affairs. 'The problem of the validity of any historical classification involves a question of values and cannot be solved on purely logical or metaphysical grounds.'² We can regard each other, and study each other, as fellow human beings only on the assumption that, underlying the equivocal differences between our relative points of view, there are some fundamental common standards in virtue of which we recognize each other as being members of one and the same human race.

'When we speak of Man, we necessarily imply the presence of certain familiar mental categories. . . . It follows, indeed, from the nature of the evidence on which all our historical knowledge is based, that history can never carry us beyond the stage where we can understand the working of the minds of the acting people because they are similar to our own. Where we cease to understand, where we can no longer recognize categories of thought similar to those in terms of which we think, history ceases to be human history.'³

'Just as facts cannot be divorced from some interpretation, so it seems impossible to divorce history from the imputation of values that are objective.'⁴ . . . Only by assuming an enveloping, transcultural pattern of values can we explain how judgments of praise and censure from ancient Egypt or Rome can be veridically comprehended by our contemporaries.'⁵

In what cases ought we to pass judgement on the strength of our belief in the existence of such common human standards, and in what cases ought we to suspend judgement in deference to our recognition that some human standards, including some of our own, have only a relative validity? Here there is no *a priori* rule to guide us; we can only feel our way; and, all the time, we are perpetually being forced into taking a line by the pressure of events. Were the Roman authorities justified in forcibly suppressing the practice of human sacrifice in North-West Africa, or the Spanish authorities in forcibly suppressing it in Middle America? Were the British authorities in India justified in suppressing infanticide, suttee, and the self-immolation of the devotees who used to throw themselves under the wheels of Juggernaut's car? From the point of view of the Punic, Aztec, and Hindu addicts to these rites, their alien conquerors were misusing their military power to

¹ Bagby, in *op. cit.*, p. 3, makes the point that 'it is only when some action is required that' one 'finds it necessary to judge other men's behaviour, and his action is all the more effective if he has first understood this behaviour in as cold and rational a manner as possible'.

The second statement in this sentence is indisputable; the preceding statement is uncontroversial if it is recognized that action takes more than one form, and that one of its forms is study.

suppress religious practices whose significance and value these aliens did not understand. Ignorant prejudice militant is certainly an ugly thing, and the Aztec citizens of Tenochtitlan can have seen nothing but an outrageous act of sacrilege in the overthrow of their gods' images and altars and the slaughter of their priests by Cortés's indignant soldiers. On the other hand, Cortés and his companions saw nothing but an atrocious barbarity in the tearing of human hearts out of living human bodies by priests whose locks were matted with their victims' blood. And the Spanish intruders had to take a line. Now that they were in Mexico and in power there, they must either suppress the local practice of human sacrifice or else condone it. How is the voice of humanity to decide between Spaniards and Aztecs in this case? Perhaps it has delivered its verdict already. If not, it will surely deliver it in time. A verdict that is both unanimous and enduring is the only conceivable last word that can be spoken in judgement between one relative set of human standards and another. And in our day the possibility of such unanimous judgements is only just coming within sight, for it is only in our day that mankind is beginning to grow together into a single family. 'The fundamental criterion . . . is generality.'¹ Generality is rooted in reasonableness.² And an all but unanimous consensus among people who recognize each other as being reasonable can be taken as being decisive, even if there are still some dissenting voices.³

It is not only conquerors and rulers who have found themselves forced to pass summary judgements on the respective merits of their own standards and those of alien peoples. Anthropologists and historians are in the same plight. Their hands too are forced by the relation into which they have entered with the human objects of their study. They cannot study without finding themselves also compelled to judge.⁴

¹ N. Rescher in *The Journal of Philosophy*, vol. lv, No. 6 (13th March, 1958), pp. 243-55, on p. 252.

² Rescher, *ibid.*
³ Rescher in *loc. cit.*, p. 254. *Ibid.*, p. 255, Rescher points out that this criterion is not absolute. Justification in ethics is always reasoned, but it is not deductive. 'We are able to bring to light in a "dialectical" manner an increasingly firm basis of reason in justifying our moral judgments.'

⁴ Kroeber, in *The Nature of Culture*, p. 6, expresses the opinion that value judgements are possible as between the values of different cultures. Redfield holds that they are inevitable and desirable. 'It cannot be proved, from the proposition that values are relative, that we ought to respect all systems of values' (*The Primitive World and its Transformations*, p. 147). He recalls that the United Nations commission on human rights did not adopt a suggestion, made to them by American anthropologists, that they should recognize the right of men to live in accordance with their own traditions (*ibid.*, pp. 147-8). Redfield testifies that anthropologists implicitly assume that civilization is better than primitive life (*ibid.*, p. 158), and he explicitly makes this standpoint his own. 'I simply could not look neutrally at the ideas that move in history towards a more humane ideal and practice' (*ibid.*, p. 141).

In an article under the title 'Are Moral Problems Genuine?' in *Mind*, New Series, vol. lxv (1956), pp. 166-83, D. H. Munro raises the question whether 'there are several alternative ethical systems, each equally valid' (p. 176), and comes to the conclusion that we cannot escape asking and answering the question: Which of two ways of life is the better? (p. 179).

In an important article under the title 'Ethical Relativity: Sic et Non' in *The Journal of Philosophy*, vol. lii, No. 23 (10th November, 1955), pp. 663-77, Clyde Kluckhohn draws attention to, and gives his own blessing to, a current turn of the tide of anthropological opinion against the extreme relativist position. As he puts it, ethical relativity still stands in certain contexts, but 'the areas of indeterminacy' have been narrowed (p. 663). 'There are pan-human universals as regards needs and capacities that shape, or could rightly shape, at least the broad outlines of a morality that transcends cultural difference'

The conclusion to which the foregoing discussion seems to point is that, in our dealings, academic as well as practical, with our fellow human beings, we must try to maintain all the time a difficult balance between two attitudes, both of which are indispensable on the evidence of experience, though they may be mutually exclusive in logic. On the one hand we have always to treat our neighbours' standards and values with the respect and tolerance that we crave for our own, notwithstanding our recognition of our own standards' relativity. On the other hand we have sometimes to pass judgements in the name of standards deemed by us, at our peril, to be common to all men. Such judgements are so hazardous that we should pass them only reluctantly and tentatively, but we must not flinch from making them in the last resort; for the price of refraining from them in all circumstances would be to break the moral bond of common humanity which is the necessary framework for any relations, academic or practical, with our fellow human beings. I therefore join issue with a scholar who maintains, without qualification, that 'we shall never be able to understand' history 'unless we first put aside all moral considerations' and that these 'must be as firmly put aside as in the study of physics and biology'.¹ In the study of non-human nature there is no question of putting moral considerations aside, because here these do not arise. In the study of human affairs it is impossible to ignore them, because they are inherent in the human observer's relation with his human subject; and there is no clear and simple rule for dealing with them. We shall go wrong if we refuse to make them, at our peril, when they do arise in this field, and we shall also go wrong if, in making them, we indiscriminately apply the relative standards of our own civilization, country, class, family, in our own personal version of them, as if these were identical with, and not, as they are, only approximations to, the fundamental common standards implicit in our having a common human nature.² I am sure that I myself have fallen into this error. Several critics have concurred in convicting

(p. 666). Cultures are not isolated monads, and some valid comparisons between them are possible (pp. 670-1). 'While the specific manifestations of human nature vary between cultures and between individuals in the same culture, human nature is universal' (p. 676). 'There are some moral standards that are 'altogether universal' (e.g. the distinction between 'murder' and killings that are felt to be justifiable) (pp. 671-2). 'Both within and between cultures moral behaviour in specific instances and in all its details must be judged within a wide context but with reference to principles which are not relative' (p. 674). 'The position of radical cultural relativity' is 'untenable' (p. 673).

These considerations against unmitigated relativism and in favour of a circumspect universalism are impressive. On the other hand, in *Toynbee and History*, Sir Ernest Barker (on pp. 101-2) and Philip Bagby (on p. 110) deprecate the condemnation of Man's past labours. A. J. P. Taylor finds (ibid., p. 121) that I am guilty of this offence. 'He lacks . . . the historian's characteristic piety towards the past.'

¹ Bagby in *Culture and History*, p. 3, and in *Toynbee and History*, p. 108. Cp. the passages quoted from Bagby and Birks on p. 54, footnote 2.

² Bagby points out, in *Culture and History*, p. 140, that modern Western psychologists have not entirely succeeded in making this necessary discrimination in their attempt to apprehend human nature in the sense of 'universal psychological traits hereditary in origin and present in every human being'. 'The formulations of the psychologists are based on their observations of their neighbours, that is, on the behaviour of bearers of Western European culture, and undoubtedly are largely tinged by the peculiarities of that culture. There can be no assurance that these generalizations apply to all mankind until all the immense variety of human behaviour has been studied.'

me of it.¹ At the same time, I believe that I should have erred no less if I had gone to equal lengths in putting moral considerations aside.

III. THE RELATIVITY OF A HUMAN OBSERVER'S APPROACH TO RELIGION

I. THE ISSUE BETWEEN TRANS-RATIONALISTS AND RATIONALISTS

IT will have become apparent, if it was not already, that a human observer's inescapable relativity is even more embarrassing for him when the object of his study is human affairs than when it is non-human nature. In the humanist's field, feelings and judgements, standards and values, assert themselves importunately and gravely complicate the inquirer's task. But this is only one of two complications that the humanist has to reckon with. For the knowledge of good and evil, with the attitudes and actions that follow from it, is one of two faculties that distinguish Man from all other creatures known to him. Since his second distinctive faculty is a controversial subject in the present-day world, perhaps the least controversial description of it will be a negative one. One may describe this second faculty as being a capacity for feeling that Man himself is not the highest spiritual presence in the Universe in which he finds himself. In fact, in entering the field of observation, Man does not come unaccompanied. He brings with him an intimation of the existence of a spiritual presence higher than his.

'There is a sense of significance beyond our feelings, of discovering something distinct and other than human experience. If consciousness means what it claims to mean, not everything of worth in the World is traceable to an origin with Man, reference to Man, or application to Man's use. The view which makes Man the measure of all things falsifies our attitudes in valuation.'²

To call this sixth sense a 'consciousness' or 'assurance' would be to beg the question, which is in dispute today, whether there is in truth a reality with which Man's religious sense puts Man in touch. The evidence is a matter of private individual experience. It cannot be verified by public observation, as we can verify the findings of physical and even social science. Yet the unverifiable findings of Man's religious sense give rise to attitudes and actions that have played at least as important a part in human affairs as the attitudes and actions arising from Man's moral faculty.

¹ Hourani, for instance, in loc. cit., p. 383, says that I have 'a moral vision of history'. Geyl, in *Toynbee and History*, p. 373, reproaches me for my 'spate of moral judgments'. Christopher Dawson notes that, in the earlier volumes of this book, 'the moral absolutism' of the author's 'judgements' clashes 'with the cultural relativism of his theory' (ibid., p. 13). Geyl (ibid., p. 372) finds that 'every age and every civilization is judged by a standard foreign to it'. This may be true in the sense that an historian cannot ever jump completely clear of the standards of his own time and place. But this is true of all historians, including Geyl himself.

² M. C. Swabey: *The Judgment of History*, p. 242. Illustrations of the point here made are given on pp. 185-7.

Thus Man's entry into the field of observation complicates the observer's vision of the Universe by introducing into it the vista of religion beyond the vista of ethics; and, if the problem of ethics is enigmatic, the problem of religion is more so. There is, indeed, no limit to the commitment incurred by the inquirer who ventures to be a student of human affairs, for, whether he has foreseen this or not, he has committed himself, in the act, to becoming a theologian too. In consternation he may try to beat a retreat from this perilously exposed position into the dead ground of 'comparative religion', in the hope that he can escape from theology under the scientific camouflage of anthropological research. But theology is an incubus that a humanist can never shake off. He may seek refuge from theism in atheism or from animism in materialism. But after each desperate twist and turn he will find himself committed to some theological position or other. Theology is inescapable, and it is dynamite. It will betray its identity through the camouflage by exploding in the end.

In most chapters of the histories of most of the human societies of which we have a record up to date, the position in regard to religion has been not unlike the position in regard to ethics. In the field of ethics, as we have seen, the differences between partially conflicting local standards and values have evoked violent feelings and sweeping judgements. The respective champions of the different sets of standards have each been apt to see in their own set the fundamental common standards of mankind, without recognizing the play of relativity or facing its implications. In this blind self-assurance and self-righteousness they have sometimes gone so far as to claim that their own code of morality was the only right one, and that variant codes were no true codes at all. But none of the belligerents in this intellectual warfare has ever denied that there is a distinction between right and wrong and an obligation to do right that is incumbent on all men *ex officio humanitatis*: they have merely denied the validity of any code of conduct except their own. In the greater part of the World for most of the time as far as our records go back, the position in regard to religion has been similar. There have been conflicts between different local practices and beliefs, and, since the first appearance of higher religions and philosophies in and after the last millennium B.C., claims have been made that this or that one of these is the only true and saving faith. But the fanatics who have denied that there is any truth or saving grace in any religion except their own, have, of course, never dreamed of denying the truth and efficacy of religion itself. So far from that, they have been eager to convert the rest of the human race to 'the true religion', with which their own religion is synonymous for them.

At this point, however, the history of religion and the history of ethics have diverged. So far there has been no known human society in which the distinction between right and wrong, and the obligation to do right, have been denied. But in more than one society, at some stage in its history, there have been sceptics¹ who have broken with the world-wide

¹ The word 'sceptic' is used in this volume in the meaning of 'disbeliever' in the tenets of religion and in the existence of the spiritual presence or presences, higher than

traditional belief that religion—at any rate one's own religion—is true and valuable. These sceptics have denied the reality of the spiritual presence or presences whose existence is the presupposition of all religions, lower or higher, including those religions that are 'false' in the eyes of some rival religion's adherents. This loss of belief in the reality of some trans-human presence or presences in the Universe leads to the conclusion that religion itself is either an hallucination or a fraud or else that it is the product of an unedifying interplay between false pretences and naïve credulity. A sceptic is bound to regard religion as a misapprehension or misrepresentation of Reality which hinders human minds from seeing and facing Reality as it is. He will, in fact, see in it 'an opiate of the people'.

Since sceptics, like other human beings, including believers, may be either idealists or cynics, their common disbelief in the tenets of religion and in the reality of religious experience will not make them all agree on the question of what their policy towards religion ought to be. Sceptical idealists will feel that religion is a scandalously fraudulent and obscurantist institution and that it is the duty of all enlightened and honest-minded men to do their utmost to liberate their fellow men's minds from the pernicious influence of this sinister social evil. A classical exposition of this point of view is the Roman Epicurean philosopher Lucretius's poem *De Rerum Natura*. Lucretius's missionary zeal to cure men of the belief in religion of any kind is as sincere and intense as a Buddhist, Christian, or Muslim missionary's zeal to convert unbelievers to his own religious faith. On the other hand, sceptical cynics may feel that the fraudulence and obscurantism of religion make this institution a convenient instrument for keeping in order such irrational and ill-behaved social animals as human beings are. A classical exposition of this point of view is the attitude and policy towards traditional Roman religion that is attributed to the Roman governing class in the second century B.C. by the Greek historian Polybius.¹ For the immediate purpose of our present inquiry, however, this difference between alternative policies to which scepticism may lead is of secondary importance compared to the intellectual problem that the phenomenon of scepticism itself creates for the student of human affairs when he has to reckon with it—and this he must do whenever and wherever scepticism asserts itself; for in this situation the humanist will either be a sceptic himself or will have to face sceptical criticism if he is a believer.

Man, which religion postulates. The word can also be used to mean a disbeliever in the whole of Man's mental image of Reality and in any possibility of apprehending Reality mentally by the use of the analytical and classificatory intellectual procedure that we call reasoning. Few philosophers have ever tried to be sceptics in this absolute sense, and none, perhaps, have ever succeeded. So far from being disbelievers in the reasoning powers of human minds, most disbelievers in religion have been convinced rationalists. These rationalist-minded disbelievers in religion have taken exception to religious beliefs, not because they have been sceptical about the possibility of any apprehension of Reality, but because they have believed in the efficacy of the human reason and have thought that the effective exercise of the reason was inexpediently inhibited by religious faith. In their eyes the objects of faith are figments of the imagination because they are data of private personal experience and therefore cannot be verified by the test of public observation and examination (see also p. 72, footnote 3, below).

¹ Polybius: *Historiae*, Book VI, chap. 56, quoted in v. 646-7.

This issue between sceptics and believers looms larger in the present-day world than in any other known society in any previous age as far as our records go back. Previous accesses of scepticism did not spread beyond rather narrow circles within the societies in which they made their appearance, and they were also relatively short-lived by comparison with the duration of those societies themselves. Each time, after a certain number of generations or centuries, this uninfected minority would die out, and society would revert to its usual state of almost universal and unchallenged belief in the reality of the objects or object of religious faith. In retrospect, however, from the standpoint of the present day, these previous cases take on significance as premonitory symptoms of a sceptical movement which started in the modern Western World in the seventeenth century of the Christian era and which, since then, has not only gone from strength to strength on its native ground but has spread over the rest of the World in the train of the Western Civilization's recent world-wide expansion. This modern Western sceptical movement originated in a moral reaction against the *odium theologicum* that had provided fuel for the so-called 'Wars of Religion'. *Tantum religio potuit suadere malorum*.¹ Men of good will deliberately took their treasure out of religious controversy and put it into scientific research, which seemed to promise to be a more innocent and also more fruitful activity. Since then, the findings of scientific research have seemed to undermine the intellectual foundations of traditional religion; and this second blow, following on the moral discredit that the Western Wars of Religion had brought upon religion itself, has now carried religious belief to a perhaps unprecedentedly low ebb.

The present-day world is divided by an intellectual barrier between the minds of believers and unbelievers which is as effective an insulator as 'the Iron Curtain' which divides a Communist from an anti-Communist ideological camp.² And we cannot tell how long this modern schism between believers and unbelievers is going to last or what its eventual outcome is going to be. It would be unwarrantable to assume that the modern sceptical movement is going to be as short-lived as its predecessors, and equally unwarrantable to predict that, if it persists, it will extinguish religious belief universally. Nor can it be foreseen what may happen eventually if unbelief and belief continue to coexist. It is conceivable that eventually both attitudes of mind might be superseded by some third outlook which would embrace both belief and unbelief and consequently exclude them both at the same time. It might, for example, come to be held, as a result of some advance in human powers of understanding, that the antithesis between 'reality' and 'unreality',

¹ Lucretius: *De Rerum Natura*, Book I, line 101. 'Such was the enormity of the evil that religion could make men do.'

² These two lines of division do not, of course, coincide. The ideological barrier runs along a sharply demarcated frontier between states of opposite ideological colours, yet even the 'Iron Curtain' has not completely sorted out the sheep from the goats. Non-Communist and Communist minorities are still to be found on what, from both standpoints, is the wrong side of the line. As for the barrier between believers and unbelievers, it does not correspond, even approximately, to any line that could be plotted on a map. All over the World today, believers and unbelievers are to be found living side by side in the same society, country, and even household.

which is a useful, or at least an unavoidable, category of thought for dealing mentally with our experience of phenomena, is inapplicable to experience of the religious kind. However that may turn out to be, the mental gulf between the believer's and the unbeliever's outlook is one of the unquestionable realities of the present-day world, and it therefore creates, for the present-day student of human affairs, a problem of relativity that is as unavoidable as it is acute.

The problem is acute because the sceptical-minded and the religious-minded student of human affairs are both living in the same world and addressing themselves to the same public, while at the same time the outlook of each of them seems, from the other's standpoint, to make human affairs unintelligible. For the religious-minded inquirer religion is the highest form of human activity. It offers Man the greatest opportunity of gaining insight into Reality, and of entering into contact with It, that is open to him in this life.¹ For anyone who holds this view, life is robbed of its purpose, and Reality of its meaning, by the sceptic's contention that religion is the shadow cast by an illusion.² Conversely, for the sceptical-minded inquirer a rational understanding of Reality is made impossible by the believer's contention that the essence of Reality is a spiritual presence which, from the rationalist's³ point of view, is imaginary, considering that its reality is vouched for only by a private personal experience that can never be verified by the test of public observation and examination.⁴

Can we find any common ground between two points of view when the assumptions in which these are respectively grounded are concerned with the very essence of Reality and at the same time appear, to human minds within the present limits of their powers of understanding, to be in diametrical opposition to each other? Perhaps a bare foothold of common ground can be obtained if we can win a concession from either side.

Believers might be asked to meet rationalists part-way by agreeing to leave the trans-human presence or presences, in whose existence and potency they believe, out of account when they are engaged in the common enterprise of trying to explain the course of human events and to analyse the structure of human society and the configurations of human culture. It is true that, in the pre-rationalist age, historians, as well as poets, treated the reported occurrences of allegedly 'supernatural' phenomena on a par with reports of human actions. Accounts of omens, miracles, and the epiphanies and physical intervention of gods were interwoven with accounts of human debates, decisions, agreements, conflicts, achievements, and failures, as if these two elements in the

¹ See, for example, Dawson, *The Dynamics of World History*, pp. 169, 171, 173.

² The Rev. E. R. Hardy Jr. counts it as a merit in me that I recognize 'that religion cannot be studied purely as an objective phenomenon' (*The Intent of Toynbee's History: A Cooperative Appraisal*).

³ The word 'rationalist' is used in this volume in the meaning of someone who believes in the efficacy of human reasoning powers to apprehend Reality at least to some extent and disbelieves in any alleged explanation of phenomena, or of the Reality underlying them, that is non-rational in the negative sense of not being vouched for by the findings of reasoning, as well as in the positive sense of being contradicted by these (see p. 69, footnote 1 above).

⁴ See, for example, Bagby, *op. cit.*, pp. 2, 57, 149-50, *et alibi*.

pre-rationalist historians' picture of the course of events were, in principle, equally credible. The reality of the 'supernatural' element was simply taken for granted. But, when once the rationalists have challenged this assumption, the onus of proving it surely lies on the shoulders of the believers. They need not be asked to repudiate their traditional assumption; they need merely be asked to refrain—unless and until they can prove it—from continuing to make it when they are engaged in recording, examining, and analysing human affairs.¹

As a matter of fact this concession has been made, in practice, by historians who have not renounced their belief in the existence and potency of trans-human spiritual presences. The reports of miraculous occurrences in terms of polytheistic religious beliefs were repudiated by Jewish, Christian, and Muslim historians long before the modern Western rationalist movement started. Since then, modern historians who have continued to be believing monotheists have tacitly taken to treating the miraculous element in their own religions' picture of human affairs as they have long since treated it overtly in the polytheistic presentation of it. Without repudiating their own belief in the existence and potency of a spiritual presence higher than Man, they have given up their former practice of introducing, into their accounts and explanations of human affairs, elements of a 'supernatural' order: that is to say, elements that cannot be observed, verified, and explained by the use of human reasoning powers.

The reciprocal concession to believers that rationalists might be asked to make is to recognize that rational explanation is imperfect and incomplete not merely in practice but intrinsically. We have seen in the preceding chapter that thought operates by classifying phenomena according to their recognizable similarities. It follows from this, as Bagby points out,² that, while it is true 'that some order, some recurrent features, must occur in any homogeneous and interrelated field of events', it is also true 'that such a field of events cannot be fully ordered; there must be some features of it which are arbitrary, undetermined, and inexplicable', and 'these consequences arise from the very notion of comparison, which requires both similarity and difference'. Thinking is an attempt to apprehend Reality by catching it in a conceptual net, and a net is able to serve its purpose in virtue of having a texture which leaves gaps between the meshes. It is this open texture which gives a net its fling. If the net were made, not of an open network, but of a tightly woven cloth, the material would be too heavy to allow a net made of it to be effectively extensive. But the price of having a texture which makes it possible to catch something in the net's meshes is the inevitability that something else will slip out of the net through the gaps.

This paradox is the crux of the intellectual procedure of rational analysis and explanation. The objective of rational thought is to discover in phenomena an intelligible system of regular and therefore

¹ This is all that is demanded on behalf of rationalism by, for instance, Bagby in *Culture and History*, pp. 148–9, or by M. Saville in *The Pacific Review*, vol. xxv, No. 1 (February, 1956), pp. 55–67.

² In op. cit., p. 58. See also the passages quoted from Bagby, op. cit., and from Redfield on p. 11, footnote 10.

predictable uniformities and recurrences. But the very nature of the intellectual procedure by which this objective has to be pursued makes it inevitable that any system established by this procedure will not, after all, be really closed but will stay untidily open. And Heaven knows what may or may not slip out—or in—through the yawning gaps between the meshes of intelligibility. There are, in short, more things in Heaven and Earth than are dreamed of in the rationalist's philosophy,¹ and he cannot be sure that the draught which is let through by the chinks in his system may not be the importunate wind which bloweth where it listeth,² and which, though it may be invisible to the rationalist's eyes, makes in the believer's ear a sound that, for him, fills the World. It looks as if the believer may fairly ask the rationalist to meet him to the extent, not of renouncing his rational objective, but of making the negative concession of recognizing that human history 'is impatient of' the 'neat systems of laws and causal sequences' for which the rationalist 'is always looking', and that the 'mysterious and unpredictable aspect of history' is a genuine and irremovable 'stumbling-block' for him.³

On the other hand, I think that an inquirer who holds, as I myself hold, that rationalism is not enough ought, none the less, to follow the rationalists' good example of recognizing that the human reason's mental net is binding in so far as it is truly effective in apprehending Reality. If I stand convicted (and I have no doubt that I do) of having sometimes lapsed from reasoning into mythologizing when reasoning would have been capable of doing the job, I admit that I have been at fault. At the same time I am alive to the limitations of human reasoning power, and I am convinced that there are questions which reasoning cannot answer but which human beings are nevertheless bound to ask, because one would be less than human if one did not ask them and did not go on to try to answer them, even though one's answers to such 'trans-rational' questions will be, by definition, unverifiable.

Questions of this sort—and they are the most momentous questions with which human beings find themselves confronted—bombard us through the gaps between the meshes of reason's net. I do not believe that these gaps can be plugged, and, as far as I know, rationalists do not imagine that they can; so this is not one of the points in dispute between rationalists and 'trans-rationalists'. There are, however, rationalists who, while recognizing that they cannot plug the gaps, imagine that they can dispose of them by ignoring their existence and turning a deaf ear to any voices that may sound through them. With rationalists who adopt this 'know-nothing' policy I am in disagreement. Whether they can dull their senses successfully or not, I do not know. But I do feel sure that, if they did succeed, they would be defeating their own purpose of trying to comprehend Reality. They would have succeeded in preserving their cherished picture of Reality as a closed system, transparent to the human reason through and through, but, in the act, they

¹ One of these things is the entry of human souls on to the scene of this planet. Is a biological mutation sufficient to account for this? This question, which is a searching one, is asked by K. D. Erdmann in *Archiv für Kulturgeschichte*, xxxiii. Band, Heft 2 (1951), p. 237.

² John iii. 8.

³ Chr. Dawson: *The Dynamics of World History*, p. 257, quoted already on p. 16.

would have been shutting their eyes to another vision of Reality that is, perhaps, likely to be rather less remote from the truth. Part of the truth about Reality, as it appears to the 'trans-rationalist' in his glimpse of it, is that it is boundless and mysterious and, for human eyes, not all of a piece. From this 'trans-rational' point of view, Reality looks like a house of many mansions, and our human reason's mansion does not seem to be self-contained, or, indeed, even semi-detached.

The point of view here described is, of course, a personal one,¹ but I have ventured to describe it, nevertheless, because I think that it brings out the point on which the current controversy between rationalists and 'trans-rationalists' turns. I am, myself, an ex-believer who first became a convert to rationalism with no reservations and has since become a convert to a 'trans-rationalist' standpoint with two reservations. One of my present reservations is in regard to rationalism. I am now more alive than I once was to the limitations of human reasoning powers. I believe that the answers to the questions that matter most to us can be found only beyond the reason's limits, if they can be found at all. So I am no longer entitled to call myself a rationalist if the label commits one to holding that human reasoning powers are capable of answering all questions that one needs to ask (capable of proving, for instance, or disproving, the existence of an absolute spiritual Reality beyond the phenomenal world). My second present reservation is in regard to religious belief. I do not think that unverifiable religious beliefs can stand against the findings of the reason within the field in which human reasoning powers are effective. So, if belief, in the religious meaning of the word, were to commit one to holding that the reason could and should be overridden on its own ground by an irrational faith, then I should be entitled, perhaps, to claim that I had become a 'trans-rationalist', but not to claim that I had again become a believer.² My present state of mind is, as far as I can judge, a common and characteristic one in the Western World in the generation into which I happen to have been born. It is an open state of mind, and the necessary price of this intellectual and moral boon is a partial break in one's vision and a certain tenseness in one's feelings. Finding myself in this situation does

¹ My point of view is personal in the sense that I cannot demonstrate its validity to someone who does not share it; but it is not personal in the other sense of being peculiar to me. It is, for example, identical with the point of view expressed in the following passage of a letter written by Gilbert Murray to Lord Russell on 26th July, 1954: "Then about faith. What I wrote about beauty, physical and moral, was, I think, based on some sort of faith: that is, on a strong consciousness that, beyond the realm of our knowledge, there was a wide region in which we had imperfect intimations or guesses or hopes. Most of the so-called faiths are these intimations worked up into the form of definite myths or dogmas, almost all of them anthropomorphic. The myth is mostly invented, but the faith at the back of it has at least a good deal of probability about it. . . . It is in some ways the most interesting part of life, the great region in which you must be agnostic, but nevertheless you must have something like conviction." The full text of this letter will be found in *Correspondence between Gilbert Murray, Lord Russell, and Bernard Shaw* (this has not yet been published). The passage here quoted will also be found in *Gilbert Murray: An Unfinished Autobiography* (London 1960, Allen & Unwin), p. 218. I am grateful to Sir Stanley Unwin for his permission to me to print the passage here.

² H. Kohn, in *Toynbee and History*, p. 354, notices that I do not believe in the feasibility or desirability of a return to traditional religious dogmas and institutions. I am, in fact, an agnostic in the sense in which the word is used by Gilbert Murray in the passage quoted in footnote 1. See further p. 98, footnote 2.

not strike me with dismay, because I do not feel that it puts me out of tune with Reality in so far as I have any intimation of what Reality may be like. I am also not aggrieved, because I feel grateful for the dark and broken glass that lets through to me my human glimmer of light. No doubt, a perfect lens would be better to have than a cracked one, but it is very much better to have a cracked one than not to have any lens of any kind. The mind's cracked lens is mankind's greatest treasure.

I have been trying to find terms for a 'gentlemen's agreement' between religious-minded and rationalist-minded participants in our present-day world-wide human society. This is probably the nearest approach that they can hope to succeed in making towards each other for the present. As far as one can see ahead, there seems to be no prospect of their being able to close the great gulf that has been opened between them by the relativity of their respective points of view to fundamental presuppositions that are in such stark disagreement as theirs are. But a gulf that cannot yet be closed can perhaps be bridged provisionally by a *modus vivendi* which may make it possible for the two parties to communicate, and even perhaps co-operate, with each other. The test of a bridge, of course, is its ability to bear the traffic. Let us now see whether the *modus vivendi* that I have suggested will hold firm or will break down if we try to make it serve as common ground for the study of human affairs in the particularly controversial field of the study of religion.

In setting out together on this inquiry, religious-minded and rationalist-minded explorers can at least find a common point of departure. For, differ as they may and will in their interpretations of the significance of religious experience, they will agree that the practices, beliefs, and institutions to which this experience has given rise always have been, and still are, a most important element in human affairs.¹ A test of whether they can travel together farther than just the first step will be their respective answers to two questions about the relation between religion and culture. If the rationalist asks the religious-minded party whether he agrees that religion is a part of human culture, this question, I should say, ought to receive the answer 'yes'. If the religious-minded party then asks the rationalist whether he agrees that religion is not only a part of culture but is also something more than that, the answer ought to be 'yes', I should say, again. If the two parties can both bring themselves to give their answers in the affirmative, they will be able to go on being travelling companions, and, what is more, they will, I should say, be taking together the road that leads towards a better understanding of Reality.

What do we mean by 'culture'? Let us use Bagby's clearly thought-out definition of it as 'regularities in the behaviour, internal and external, of the members of a society, excluding those regularities which are

¹ They can, of course, still differ in their estimate of religion's relative importance. For instance, Geyl, in *Debates with Historians*, pp. 138-9, maintains that I pay too much attention to religion and show too little concern for social betterment. In Geyl's opinion, my belief in the outstanding importance of religion is subjective: it cannot be proved by history or be disproved by it.

clearly hereditary in origin'.¹ Religious practices and institutions, and, by implication, also religious beliefs and experiences, are certainly a part of culture as thus defined, and in another passage² Bagby explicitly mentions religion, together with art, technology, and social structure, as examples of the elements of which culture consists. We can agree that religion is one of these elements without needing to try, at this point, to give either a complete list of them or a systematic account of their relations to each other.

Sorokin seems to hold that the culture elements that one finds present simultaneously in the participants in a society, collectively and individually, are merely casual conglomerations,³ but here he is surely flying in the face of the evidence presented by the phenomena. In the light of this evidence most sociologists and anthropologists hold that one of the intrinsic properties of culture is that its component elements are integrated in some degree—that culture has, in fact, what Kroeber has called 'configurations'. No doubt there are any number of possible degrees of integration in any number of possible varieties of pattern. In all cultures some of the elements may be more closely tied than others to each other and to the culture itself in virtue of their respective natures. Religion and art, for instance, have often been closely associated with each other, and art, at any rate, seems to be one of the clearest and most precise expressions of a culture's distinctive character. If one is trying to ascertain the duration of some particular culture and its geographical distribution at different times, the presence or absence of its distinctive style of art is one of the surest and most accurate clues. By contrast, technology is less informative. The partakers in some particular culture have sometimes made revolutionary changes in their technology without this having produced any immediate change of comparable magnitude in the culture as a whole or in any of its non-technological parts. It looks as if a culture's technology sits more loosely to it than its art sits. And, in fact, in the technological field there seems always to have been a great deal of give-and-take between different cultures. In whatever culture a technique may have originated, it has been apt to spread beyond the parent culture's limits, and the history of technology can perhaps be understood best by regarding technology as having been, from the start, a common achievement and possession of all mankind, and also one which, so far, has improved progressively while cultures, as integrated 'configurations', have been coming and going.

Thus different parts of culture seem to display intrinsic differences in the degree of their integration with each other and with the total configuration of the particular culture in question. There are, no doubt, also differences in the degree of overall integration as between one culture and another, and also as between one phase and another in the history of some single culture. In an agricultural village community or in a pastoral nomadic tribe, we should expect to find a more highly integrated state of culture than in a great cosmopolitan city at an advanced

¹ Bagby: *Culture and History*, pp. 84 and 95; cp. pp. 93–94. See further pp. 272–3 of the present volume.

² Bagby, *op. cit.*, p. 93.

³ Sorokin in *Toynbee and History*, pp. 180–1, 182, 188.

stage in the history of a civilization. It is here, if anywhere, that Sorokin's description of a culture as being a conglomeration of casual elements might come nearest to being a convincing account of the phenomena. Again, when an 'age of faith' begins to give way to an 'age of reason', as it did in the Hellenic World in the fifth century B.C. and in the Western World in the fifteenth century of the Christian Era, art tends to dissolve its traditional association with religion and to strike out on an independent course of its own.

Religion is certainly one of those parts of culture that have usually been closest to the heart of it and also most closely associated with other parts; and this generalization becomes more clearly valid the farther we look back into the past. In all societies, including civilizations of the first and second generations, down to the rise of the 'higher religions' in and after the last millennium B.C., religion has been intimately connected, not only with art, but also with social structure, political organization, and economic activities. The connexion with economics seems to have come earliest. Before Man had gained the upper hand over non-human nature, the elements in his environment from which he was wresting a precarious livelihood were the medium through which he felt himself to be in touch with the spiritual presences, higher than himself, in whose existence and potency he believed.¹ It has been only in societies in which a considerable, and influential, minority of the population has been living an urban life for a considerable time that the worship of gods manifest in Nature has fallen into the background; and then, when Man has become confident enough in his own powers to begin to divest Nature of her aura of divinity, he has come to find a more impressive manifestation of the godhead in his own social organization and in the collective power which he has acquired through this. In this next stage religion comes to be connected with politics more pronouncedly than with economics. The gods who now inspire the strongest feelings of awe, fear, and love are manifestations of divinity seen through the medium of states. The god of the city-state of Nippur or goddess of the city-state of Argos now overshadows the storm-god or the corn-goddess; and Athene holds her worshippers' allegiance as the divinity manifest in Athens rather than as the one manifest in the olive-tree.

Eventually the advent of the higher religions brings with it a new vision of the trans-human spiritual presence. Whether this is experienced as being immanent or as being transcendent, as being personal or as being impersonal, in every mode it is now experienced direct, and not through either an economic or a political medium. But the higher religions have so far had to incorporate almost as much as they have been able to abolish in the traditions of the earlier religions that they have sought to supersede. In the annual cycle of the liturgy of the Christian Church, as this is still observed in many of the Church's present branches, the underlying annual cycle of agricultural operations is manifest. The most conspicuous manifestation is in the thanksgiving

¹ 'Even in primitive nature-worship, the object of religious emotion and worship is never the natural phenomenon as such, but always the supernatural power which is obscurely felt to be present and to be working through the natural object' (Chr. Dawson: *The Dynamics of World History*, p. 173).

service for the harvest. Again, when in a Christian place of worship a *Te Deum* is sung to celebrate the victory of one professedly Christian state in a battle with another, the god to whom the thanks are given is manifestly the 'god of battles' who is the symbol of the collective power of a local political community, rather than the One True God who, according to Christian doctrine, is the common god not only of all Christians but of all human beings and all other created things.

It will be seen that, in the past, the association of religion with other parts of culture has been intimate. There has, it is true, been a tendency, in the histories of some civilizations, for art to part company with religion, and an inverse tendency, in the history of mankind as a whole, for religion to part company with economics and politics. But these dissociative movements have been tardy and gradual, and religion seems to have been less successful in achieving independence than art has been. The judgement that religion is a part of culture is confirmed and fortified by the evidence of religion's ancient and persistent connexion with other parts of culture whose status as such is not in dispute. If religious-minded students of human affairs can agree with their rationalist-minded confrères on this point, they will have found a piece of common ground. But this agreement on one important question of fact will have had the disconcerting effect of widening the area of their disagreement on a question of interpretation.

Let us suppose that they had been able to agree, instead, that religion was *not* a part of culture and was *not* connected with other phenomena that *are* parts of culture beyond dispute, then the disagreement between them over their respective interpretations of the significance of religion would have been confined to the topic of religion itself, and they could have agreed without reservation or ambiguity that culture, minus religion, is an exclusively human phenomenon that can be interpreted as such without any dispute over the question of the existence or non-existence of trans-human spiritual presences. On the other hand, when it has been agreed that, in the past, religion has not only been a part of culture but has been a highly pervasive part, intimately connected with a number of other parts, the dispute over the interpretation of the significance of religious experience extends itself, *pari passu* with religion's pervasive influence, over the whole field of culture. So the gulf between the two points of view yawns wider than ever; and this is, after all, only what is to be expected; for the cause of the gulf is the relativity of the two points of view to their respective fundamental presuppositions, and the conflict between these presuppositions will not have been overcome by an agreement on one question of fact. The only effective way of overcoming—or, short of that, of mitigating—this conflict is for each party to make the moral and intellectual effort to examine, analyse, and criticize his own bias.

The barrier of relativity—persisting, as it does, so long as it is left unanalysed—alienates the religious-minded and the rationalist-minded inquirer not only from each other but also from some of the common human objects of their study, since some of these will be in the opposite camp to the inquirer's, whichever of the two inquirers he may be. For

both inquirers this is an obstacle to achieving the sympathy without which there can be no understanding. But up to the present this handicap has been less formidable for the religious-minded student of human affairs than it has been for the rationalist, simply because, up to date, the vast majority of human beings have been religious-minded, whereas the rationalists, into whose state of mind it might be difficult for the religious-minded inquirer to enter sympathetically, have been comparatively few and far between. By contrast, the rationalist-minded humanist has to study a world of men with whom he is out of sympathy with the exception of a few kindred spirits that catch his eye here and there.

A classical example of the un-self-critically rationalist-minded observer's handicap is the limitation which this state of mind imposed on the achievements of so great a genius as Gibbon. Gibbon's case is an outstanding one, because he was a genius who was rationalist-minded to an almost naïvely un-self-critical degree and who chose for his field of study an epoch of history in which a temporary access of rationalism was engulfed by a resurgence of religious faith. In Gibbon's eyes the spirit of Hellenic rationalism was identical with the spirit of the Western rationalism of Gibbon's own day. It was the same intellectual light dispelling the same darkness of ignorance and superstition; and Gibbon's subject was the submergence of Hellenic rationalism by the rise of Christianity. He saw his theme as the story of a catastrophe. What had happened was shocking because it had condemned civilization to undergo a long-drawn-out eclipse, and it was also inexplicable because it was not consonant with the rationality which, as Gibbon saw it, is not only part but the whole of what is distinctively and creditably human in human nature.

In approaching this subject from this standpoint Gibbon could hardly help seeing almost all the characters on his stage in one or other of the two roles of fool or knave. If they were not cheats, they must be dupes. *Ex hypothesi*, a rational human being could not really believe in religion, so, if someone who was unmistakably rational professed to believe in it, he must be an imposter who was seeking to deceive his fellow men for his own self-interested purposes. Conversely, if someone was an unmistakably sincere believer, he must be an irrational fool. The psychological barrier that the relativity of Gibbon's outlook interposed between the historian and the great majority of the figures passing across his stage prevented Gibbon from entering into the true motives and feelings of many of these actors, and therefore also prevented him from gaining a really penetrating insight into the meaning of the play. Gibbon's failure in these two respects—and the two points are both crucial—strikingly illustrates the seriousness of the handicap imposed by relativity when this is not corrected by self-criticism; for Gibbon's mind was surely the most powerful and most lucid one that has appeared so far in the whole distinguished company of Western historians up to date.

2. THE HIGHER RELIGIONS' DECLARATION OF INDEPENDENCE AND ITS IMPLICATIONS

The un-self-critically rationalist-minded humanist is likely to run into still greater trouble if he is not content to have a consensus that religion is a part of culture, but goes on to insist that religion is merely this and nothing more. Romein and Bagby appear to take this second position if I have rightly interpreted their meaning.¹ It is a position that gets its holders into difficulties when they come to deal with cultural and social morphology; for, in this field, it is only, it seems to me, by forcing facts and begging questions that one can stow away all specifically religious institutions entirely inside the framework of other institutions which may have a tincture of religion in them, but which are not themselves primarily institutions of a religious kind. The impracticability of this procedure may not be apparent at first if one approaches one's morphological studies in historical order, starting with pre-civilizational societies and going on to civilizations. The difficulties come to light when one comes to higher religions.

The problem of morphology presents itself because 'culture' and 'society' are abstractions. It is possible to define them; 'Culture' can be defined, as we have seen, as 'regularities in human behaviour',² and 'society' perhaps as 'the total network of relations between human beings'.³ They can be defined, but the subjects of these definitions cannot ever be met with in real life. What we do meet with and are able to observe and examine are not 'culture' and 'society' but 'societies' and 'cultures'. Particular cultures are observable as regularities in the behaviour of human beings who are participants in particular societies, besides being partakers in the cultures that are respectively characteristic of these. A society, with its cultural expression, and a culture, in its social setting, are institutions that have structures. What is the relation of religion to these social and cultural structures? In the singular number 'religion', like 'society' and 'culture', is an abstraction. What we meet with in real life is not 'religion' but 'religions'; and 'religions', like 'societies' and 'cultures', have institutional structures. The question that arises is: Are these religious institutional structures nothing more than parts of other institutional structures that are not religious structures exclusively or even primarily? Can all the religious institutional structures that are now in existence, or are known to us from the historical record, be classified and explained satisfactorily as being parts of

¹ In *Toynbee and History*, p. 348, Romein writes: 'From my viewpoint, all religious phenomena are part of the social whole, a product, an important product, no doubt, perhaps the most important, but nevertheless a product only of society itself.' Ibid., p. 107, Bagby writes: 'It [religion] is merely a part or aspect of civilization, one of those systems of practice and belief which go to make up a way of life. It cannot be isolated from its social and cultural context and turned into a primary agent.' In *Culture and History*, p. 175, Bagby writes: 'Religion is . . . only one aspect of culture and cannot give its name to the whole; we are no more and no less entitled to speak of "Christian civilization" than of "Democratic" or "Monarchical civilization" or, for that matter, of "Tea-drinking civilization".' These terms do not cover empirically discoverable entities; they are rather classes into which we put various cultures because they share a single culture-trait or complex.

² See further pp. 272-3.

³ See further pp. 271-2.

other institutional structures of other kinds? Or are there some religious institutional structures, at any rate, that can be classified and explained only as being representatives of a separate and independent institutional category?

Let us try the policy of treating religious practices and institutions simply as parts of the culture of some society, or some community within a society, that is not primarily, or at any rate not solely, religious in character. This policy seems to work so long as we are dealing with pre-civilizational societies and civilizations of the first generation. In these societies, as we have seen already, religion is closely connected, not only with art, but with economics, and, later on, with politics, and further inspection shows that religion also enters into almost every other kind of activity in which the participants in these societies engage: for instance, war, education, and recreation. These societies do, in fact, seem to be highly integrated and more or less self-contained; and their religious horizon seems to coincide with their boundaries on other planes.

This is obvious in the case of the political divinities; their respective realms do not even embrace the whole of the society in which their worshippers participate. A political god's writ runs only within the frontiers of the local state whose collective power he or she symbolizes; and, even in those rare cases in which a local state—say Babylon or the Thebaid or Rome—expands into a universal state, the realm of the presiding god or gods—Marduk or Amun or Dea Roma and Divus Caesar—expands only up to the limits of the worshippers' empire. It might seem, at first sight, as if the older gods, in whom the super-human spiritual presences manifest themselves through the medium of non-human nature, must, like this medium, have a more or less world-wide range. Olives grow in other countries besides Attica; Mother Earth yields corn at other places besides Eleusis; and the sea has no bounds. So how can the Attic olive-goddess Athene and the Eleusinian Earth-goddess Demeter and the Corinthian sea-god Poseidon be merely local divinities? Demeter of Eleusis did, as a matter of fact, extend her realm beyond Eleusis and beyond Attica to embrace the whole Hellenic World; but in this she was exceptional. Local nature-gods who reigned in principle wherever their natural media—sea, corn, olive-trees, and so on—were to be found, were in fact conscripted by their local worshippers to concentrate their attention on meeting local economic needs. In fact, economic as well as political divinities were community-bound. There were as many of each of them as there were communities to require their services. Even the goddess whose medium was the boundless Earth was not allowed to be one and indivisible. Every economically autarkic territory had, under some name or other, a Demeter of its own.

So long as the horizon of religion is thus bounded by the borders of regional societies, or even by the frontiers of states into which such societies are divided up or unified politically, it remains possible to treat religion just as a part of culture and as nothing more. But the possibility of continuing to take this line becomes doubtful and disputable when the 'higher religions' make their appearance.

Higher religions, as a class, may be defined by characteristics of theirs which are revolutionary new departures. They catch a new vision of the spiritual presences, higher than Man, in which these presences are no longer seen through the medium of human economic and political needs and activities but are seen direct as powers that are not implicated *ex officio* in their local worshippers' human concerns.¹ These powers may reveal themselves to human beings either as transcendent or as immanent in the inward experience of sensitively attuned human hearts. But, whichever way they choose, they make their presence felt as an act of grace towards human beings to whom they owe no obligation and on whom they are not in any way dependent. If the trans-human spiritual presence is experienced, not in Its personal aspect as God, but as an impersonal state of spiritual being, as It is in the experience of a Buddhist spiritual athlete, the quest for Nirvāna requires the arhat to extricate himself not only from society but from self-hood. In either case there is a disengagement of the trans-human spiritual presence—and, with It, of Its worshippers—from the highly integrated life of some particular local community, and this disengagement has the consequence that the presence's realm now comes to be thought of as being coextensive, not with some local state or some regional civilization, but with the entire Universe, while Its worshippers come to feel themselves members of a church that, in principle and in intention, embraces all men.

In short, the higher religions are entitled to their distinctive name because they have a vision of the godhead as being sovereignly self-sufficient and omnipresent, instead of any longer thinking of It, in traditional terms, as being indentured to the service of local worshippers, being tied down to their territory's soil, and being debarred from breaking bounds by the presence, in adjoining territories, of other local divinities of the same order, who have corresponding rights and duties on their own no less narrowly and jealously circumscribed home ground. If the trans-human spiritual presence, when It is experienced direct, is seen, as in the Buddha's vision of It, no longer as a personal godhead but as an impersonal Nirvāna, then Its disengagement from the traditional configurations of the particular culture of some particular society will be more radical than it will be if the direct vision of the presence does not obliterate the traditional anthropomorphic image of It as a divine person. Yet, even if the personal aspect of the presence survives the new experience of It, this new experience will have the revolutionary

¹ In the Weltanschauung of primitive societies, Man, Nature, and God are not differentiated from each other (R. Redfield: *The Primitive World and its Transformations*, p. 104). 'Neither an absolutely unconditioned God nor a wholly secular description of natural law is conceivable in a savage or barbaric settlement before the rise of cities' (ibid., p. 102). A spiritual tension over the difference between what is and what ought to be seems to have made itself felt first as a result of the experience of 'the First Intermediate Period' in both Egypt and Sumer (Chr. Dawson: *The Dynamics of World History*, p. 116). The revolutionary spiritual event was the experience (authentic or illusory) of the establishment of direct communion between individual human souls and an Absolute Spiritual Reality transcending the world of Nature (and also the world of human society); and this dates from the last millennium B.C. (ibid., pp. 117-18; cf. p. 177). 'It was in India that the decisive step was first taken, and it was in India that the new view of Reality was followed out unwaveringly in all its practical implications' (ibid., p. 118).

cultural and social effect of breaking up the previous comprehensive cultural integration of the society in which the new vision is attained. In fact, the epiphany of a higher religion splits an integrated culture in a way that is comparable to the splitting of undifferentiated Reality by the awakening of consciousness.

If this is the higher religions' nature and effect, it will be inherent in their nature that they should find their social expression in independent organizations of their own and that they should engage in missionary activity. When the trans-human spiritual presence is seen direct instead of through the medium of human social needs and activities, human beings who have attained this new vision will be impelled to act on it in two new ways. They will want to enter into a new association with each other, independent of their traditional social ties; and they will want to communicate to the rest of mankind the saving truth about Reality that has been revealed to, or been discovered by, the adherents of the new religion in their belief. The emergence of this impelling sense of mission, with nothing short of the whole World for its field, raises the question whether the histories and institutions of the higher religions can really be stowed, like those of older religions, within the frameworks of the histories and institutions of particular pre-existing societies of a kind that is not primarily religious. May it not be found that the higher religions must be treated as societies of a new species, and must therefore be regarded as phenomena which cannot be dealt with in terms of any other species than their own if they are to be dealt with adequately—that is to say, intelligibly? This question can be brought into sharper focus. Can the higher religions be dealt with as if they were simply parts of the cultures of the civilizations, which were the highest species of society in existence at the time when the higher religions emerged? Can each of the higher religions be regarded as being one of the products and expressions of some particular civilization, and as being nothing more than that?

An orderly rationalist mind will be reluctant to be convinced that this question cannot be answered in the affirmative; for, if it can be, without doing violence to the phenomena, this will be a victory for simplicity and for clarity.¹ It will make for simplicity because it will allow the student of human affairs to go on dealing with human history, since the emergence of the earliest civilizations about five thousand years ago, in terms of a comparative study of this species of society and this one only. The subsumption of higher religions under civilizations will also make for clarity, because it will make it possible to go on treating religion simply as a part of human culture. It will make it possible still to avoid grappling with the controversial question whether the spiritual presence higher than Man, that is vouched for by unverifiable religious experience, is Reality itself or is a prodigious illusion. The powerful appeal of this rational quest for clarity and simplicity got the better of me, for one, when I was working out my original plan for this book. I decided to try to bring the whole field of human affairs,

¹ 'We are inclined to believe that the ultimate laws of Nature are not only few but simple' (H. W. B. Joseph: *An Introduction to Logic*, 2nd ed., pp. 506-7).

since the appearance of the earliest civilizations, within the framework of a comparative study of civilizations.¹ And, before I started to put this decision into action, I was reassured by the publication of the first volume of Spengler's work, in which I found that my own intended plan of operations had been anticipated, with apparently complete assurance, by an inquirer who was obviously a man of genius. The same plan of operations has since been followed by Bagby;² and I should guess that he, too, was attracted to it by the promise of clarity and simplicity that this plan appears to hold out before one has begun to put it to the test of applying it to the phenomena. This empirical test raises the question: Do the phenomena allow of this apparently clear and simple solution of the problem presented by the appearance of the higher religions? This is a difficult question to answer, because it is difficult to find anyone who is in a position to approach it impartially, without *parti pris*. The most that anyone can do is to get to grips with the phenomena in as open-minded a mood as he can muster up.

3. THE HIGHER RELIGIONS' STATUS IN THE LIGHT OF THE PHENOMENA

If we start by looking at the three oldest of the higher religions—Judaism, Zoroastrianism, and Hinduism³—we may be inclined to judge that these can each be subsumed under a particular civilization more or less legitimately.

It is true that all three, like other representatives of the new species of religion, conceive of the godhead as being sovereignly self-sufficient and omnipresent. Brahmā, Ahuramazda, and Yahweh reign, each of them, over the whole of mankind and the whole of the Universe.⁴ They are not just the respective communal divinities of the Hindus, the Parsees, and the Jews. It is also true that the followers of all three religions have shown concern to propagate their faiths. The Jews converted to Judaism the royal family of the kingdom of Adiabene (in what is now

¹ Here, I think, I was committing the sin of pride of which several critics accuse me (see Chapter II, Annex: *Ad Hominem*, p. 638). I stand convicted, I am afraid; and this is, I also fear, presumptive evidence of conceitedness. The only defence that I can plead is that I have since changed my plan as a result of my experiences in trying to carry it out in its original form.

² In *Culture and History*.

³ For the purpose of the present argument, I am using the word Hinduism in its more usual sense as meaning the indigenous religion of India from the close of the interregnum following the dissolution of the Indus Culture down to the present day (the religion of the Indus Culture remains unknown to us so far, save for a few flashes of light that have been thrown upon it by some of its disinterested artefacts). In vols. i-x I have provisionally confined my usage of the word to mean only the post-Buddhaic indigenous religion of India. This usage of mine has been disputed, together with the chronological caesura, tentatively drawn by me in Indian history, with which it is connected. These points are discussed in the present volume on pp. 182-4, below.

⁴ Ahuramazda's omnipotence is, of course, contested by his adversary Angramainyush; Yahweh's omnipotence is defied by his adversary Satan; and Brahmā is made manifest to men in the form of a host of emanations, who, looked at historically, are survivors from a previous polytheism with which Hinduism has never made a break. On the other hand, in the Hindu vision of the godhead, its personal facet, Brahmā, has a complement in an impersonal facet, Brahman. And Brahman is more remote and farther withdrawn from implication in human affairs than either Yahweh or Ahuramazda, who have never been followed beyond the range of personality in their worshippers' vision of them.

'Iraqi Kurdistan), in the first century of the Christian Era, and the royal family of the Turkish Khazar horde, on the steppe between the Lower Volga and the Lower Don, in the eighth century; and, in the fastnesses of the Caucasus and of the Semyen Mountains in Abyssinia, there are today highland clans professing the Jewish religion whose ancestors must have been converted to Judaism by Jewish missionary enterprise. Zoroastrianism, again, was propagated in the time of the Achaemenian Empire (550/525-331 B.C.) to Cappadocia, and, in and after the time of the Sasanian Empire (A.D. 224-651/2), from Iran and the Oxus-Jaxartes Basin across the Great Eurasian Steppe to Northern China. As for Hinduism, it was propagated eastwards from India as far across Indonesia as the island of Bali and, on the mainland, as far as what is now Southern Vietnam.

These three religions thus display the two distinctive marks of their class; 'an ancient civilization was transmuted by a series of challenges into a universal religion';¹ yet none of the three ever took the new road decisively; all three remained straddled ambiguously with one foot on either side of the line marking the new departure. In their conception of the role of Almighty God, their adherents became arrested in a state of double thinking which, to Christian and Muslim minds, seems paradoxically inconsistent. After they had come to think of God as the omnipresent lord of the Universe, they went on thinking of Him at the same time as still being the peculiar local god of the society or community in which He had originally been worshipped as such. Thus, each of these three religions, in becoming a higher religion, still also continued to be a part of the integrated culture of a particular community or society; and it has never become feasible to be converted to the Jewish, the Zoroastrian, or the Hindu religion without at the same time having to become a naturalized member of Jewish, Zoroastrian, or Hindu society.² Conversion to Judaism or Zoroastrianism has involved submission to a system of law³ in which religious observances are inextricably intertwined with what, to Christian and Muslim minds, would seem like purely secular regulations. Conversion to Hinduism has involved incorporation in a caste and submission to the restrictions that the Hindu caste system entails.⁴ This explains why conversions to these three religions have been rare, and why their adherents have been no more than half-hearted in their efforts to bring gentiles into their jealously guarded folds.⁵ The source of the perennial ill-feeling between

¹ Rabbi J. B. Agus, in *Judaism*, vol. 4, No. 4 (Fall, 1955), p. 332.

² In Jewish history 'there resulted in the post-Biblical period a unique combination of a perfectly universalistic religion with an intensely nationalistic ethnic group' (Agus, in *Judaism*, 1956, p. 30).

³ 'To accept Judaism without accepting the Mosaic Law is a contradiction in terms' (E. Berkovitz: *Judaism: Fossil or Ferment?* p. 76).

⁴ All the same, when Hinduism was propagated into Indonesia and into continental South-East Asia, 'the Indian social structure, with its caste system, was less thoroughly absorbed than was the religious' (H. G. Quaritch Wales: *The Making of Greater India* (London 1951, Quaritch), p. 20).

⁵ Agus holds that ethnic loyalty diverted the Jews from missionary efforts, in spite of the fact that 'the Jewish religion was as universalistic in its teaching as Christianity or Islam. . . . The Talmud operates consistently on the supposition that a deep line of distinction must be drawn between the rights of Jews and non-Jews' (Agus in *Judaism*, 1956, p. 45; Cp. Juvenal: *Satura XIV*, ll. 101-4). At the same time Agus points out that, in

Jews and gentiles, and of the tragedies and atrocities in which this has repeatedly come to a head, is the inability of both gentiles and Jews to tell whether being a Jew means being an adherent of a religion or whether it means being a partaker in the culture of a community that, even in dispersion, has retained its original ethnic character.¹

The question whether Judaism is part of the culture of a community or whether it is a religion that can be embraced by anyone, whatever his ancestral culture or his local nationality may be, is the question that was at issue, in the first generation of Christianity, between the Jewish Christian church and the gentile Christian church created by the missionary work of Saint Paul. And it is significant that the secession of the Christian Church from Jewry, which followed in spite of Paul's and Peter's unanimous desire to avoid the breach, was not the only case of its kind. Six hundred years later another new religion inspired by Judaism, namely Islam, parted company with Jewry, as Christianity had done, on a mission to convert the gentiles to the saving truth which the Jews themselves had been keeping to themselves,² like the talent

the Gospels, the Pharisees are described as being eager to make converts. See, for example, Matt. xxiii. 15.

¹ The ambiguity of the attitude of some Jews, at any rate, on this point is illustrated by the following set of passages in M. Samuel's *The Professor and the Fossil*: 'When a Jew considers his Americanism or his Englishhood as a substitute for Judaism and a replacement for his feeling of participation in the Jewish peoplehood... he secularizes himself out of his Jewish identity' (p. 180). 'Neo-Zionism was an instinctive counter-move against the threat of assimilation presented by specific modern conditions' (p. 197). At the same time, Samuel maintains that to say that the Jewish ethos was incompatible with the functions of modern citizenship would be to declare the Jewish ethos immoral—a point of view not worth arguing with' (p. 196).

To judge by these passages, Samuel's position seems to be that a Jew would be failing to do his full duty towards Judaism if he were to decide to do his full duty as a citizen of the gentile country of which he is a citizen *de jure*, but that it would be offensive in a gentile to point out that a Jew who took this line was deliberately assuming two incompatible obligations and was trying to have the best of both worlds.

In another passage (p. 263), Samuel suggests that being a good Jew, in his sense, may be incompatible, not only with being a good citizen of a gentile state, but even with being a good human being. 'I have asked myself whether a strong feeling of history within one's own people makes it impossible to share in the general sense of history; whether this kind of belonging and inclusion must lead to a proportionate not-belonging and exclusion; whether, in short, this is a form of egocentricity destructive of one's all-human consciousness.'

If Samuel may be taken as being representative of one of several present-day Jewish states of mind, these passages suggest that, in some Jewish minds today, there is a still unclarified ambiguity on the questions what it means to be a Jew and what attitude towards gentiles this entails. If so, it is perhaps natural that some present-day gentiles—including, for instance, me—should also be somewhat in the dark on these points. Rabbi Agus is right in saying of me that 'his judgment derives from an ambiguity in the use of the term Judaism. At times he equates Judaism with the ethnic culture of Jewry; at other times he thinks of the Jewish faith as a separable pattern of ideas which is included more or less in our modern Western culture' (*Judaism*, vol. 4, No. 4 (Fall, 1955), p. 321). 'He tends to lose sight of the distinction between Judaism and "Jewishness" or the national-cultural civilization of Jewish People' (*The National Jewish Monthly*, November 1956, p. 40).

² Rabbi J. B. Agus explains the secessions of Christianity and Islam from Judaism in terms of one of the ideas put forward by me in the present book (viii. 10): it was a case of barbarians capitulating to a superior culture by adopting it and at the same time still asserting their own cultural distinctiveness by adopting the superior alien culture in an heretical form (*Judaism*, 1956, p. 41). The combination of Jewish monotheism with Jewish nationalism inevitably produced this gentile reaction. In Christianity and Islam 'the [Jewish] message was twice accepted, but the messenger was twice rejected' (*ibid.*, p. 39. Cp. E. Berkovitz, *Judaism: Fossil or Ferment?*, pp. 45-46 and 48-49).

Agus criticizes (*ibid.*, pp. 19-20) Klausner's view—shared by Dubnow and by contemporary Christian scholars, e.g. Wellhausen—that the reason why Jesus was rejected

wrapped in a napkin and buried in the earth by the servant in one of Jesus's parables. In the history of Zoroastrianism it has been the same story. During the age in which Zoroastrianism was the established national religion of the Sasanian Empire, Manichaeism seceded from it in the third century of the Christian Era and Mazdakism in the fifth century; and in the following age, when the Sasanian Empire, as well as half the Roman Empire, had been conquered by the Muslim Arabs, the new regime's Zoroastrian subjects in Iran were converted to Islam much more rapidly than were its Christian subjects in Iraq, Syria, and Egypt. In the history of Hinduism again, Buddhism and Jainism seceded in the sixth century B.C.

These portentous secessions are evidence of an unresolved tension in the bosom of the Jewish, Zoroastrian, and Hindu societies between a will to transform the ancestral religion of one people into a religion for all men and a reluctance to cast before swine the pearls that were the spiritually privileged people's heirloom. The tension resulted in repeated secessions because, in each of these three cases, a people that had seen the vision of a higher religion could not bring itself to go the whole way either in accepting the consequences or in rejecting them. It shrank from paying the price of collective self-abnegation that has to be paid by a 'Chosen People' if they are to become the missionaries of a world-wide faith; yet, at the same time, it could never turn its back on this vision when once it had seen it. This indecision condemned each of these three peoples to become a house divided against itself.

This infirmity—common to Judaism, Zoroastrianism, and Hinduism—of hovering on the borderline between two different ideals makes it just possible for a systematist to treat each of these three religions as being no more than the religious component (or part of this) in the culture of one of the civilizations. The same tendency to relapse from a universal into a communal outlook can also be observed in the histories of Buddhism, Christianity, and Islam. For instance, in Tibet, until the other day, the ecclesiastical institutions of Buddhism were being employed to serve as the political machinery for a national government. In Western Europe, for nearly a thousand years ending in the nineteenth century, many local states besides the Papal States were governed as prince-bishoprics. Trent, Salzburg, Passau, Mainz, Cologne, Trèves, Liège, and the County Palatine of Durham are examples. Conversely, there are still today a number of countries in which Christianity has been

by the Jews was because his teaching was supra-national. Klausner admits that all the *logia* attributed to Jesus appear in the rabbinical literature too; and the Pharisees, Agus here points out, were universalists, whereas at least one passage in the Gospels, Matt. xv. 21-28, is more contemptuous of gentiles than any passage in the Talmud. As Agus sees it, Jesus was rejected, not because he was not a nationalist, but because, in the eyes of contemporary pharisees, he did not make good his claim to be the Messiah.

On this showing, the true founder of Christianity, in its historic form as a universal religion, would be, not Jesus, but Paul, when he won his point that membership in the Christian community need not carry with it an obligation to observe the rules of the Mosaic Law.

Agus (*ibid.*, pp. 30-31) cites Y. Kaufman's thesis that the reason why Christianity failed to convert the Jews—whereas it did convert the World—was because the World needed monotheism, whereas the Jews already had it. According to Kaufman, 'the Jewish religion maintains automatically the wall of ethnic alienation between Jew and Christian', and therefore the Jews cannot accept assimilation wholeheartedly.

reduced to the status of a national religion incorporated in the establishment of some national government. This is, for instance, still the status of Episcopalian Protestantism in the Kingdom of England, minus Wales, and of Eastern Orthodox Christianity in every country, except those now under Communist rule, in which this form of Christianity is prevalent. In the Islamic World, again, the Shi'ite sect of Islam is today still the established national religion of the Kingdom of Iran; and a consideration of the early history of Islam, during the first century and a half after the opening date of Muhammad's preaching at Mecca, suggests that Islam as a whole nearly lapsed into becoming the national religion of the Arabs—a fate which would have prevented it from being, as it has been, a missionary religion with a world-wide appeal.¹

Is it possible, then, to dispose of Islam, Christianity, and Buddhism in the way in which it might conceivably be just possible to dispose of Judaism, Zoroastrianism, and Hinduism? Can each of these other three religions, likewise, be assigned by a systematist to this or that civilization and be labelled as the religious component—or as part of the religious component—of the container-civilization's culture? Spengler has taken this line uncompromisingly. In his morphology of human affairs since the emergence of civilization, the higher religions find a place only as elements in the structures of the civilizations and as incidents in the histories of the civilizations' rises and falls. Bagby, in his prolegomena, follows Spengler's lead, apparently without misgivings. I took the same line myself till I was pulled up short by the intractability, as I saw it, of the phenomena when, in carrying out my plan of operations, I reached the point at which I had to come to grips with the problem of the higher religions' place in human affairs. Bagby would have been confronted by the same problem if he had lived to reach the same point in the testing of his original hypotheses.

In his prolegomena Bagby gives the same list of six higher religions that I have given in the present chapter, and he fits each of them into the framework of some one or other of the nine major civilizations in his list of civilizations.² Buddhism, as well as Hinduism, is taken as

¹ See Chapter XIV, pp. 470-1.

² The form of words which he uses is that these six religions each 'originated within a major civilization' (*Culture and History*, p. 173). This would be true and indisputable if, for the sake of the argument, we were to recognize the existence of Spengler's 'Magian Civilization', which Bagby has adopted under the name 'Near-Eastern Civilization' (see *ibid.*, pp. 167 and 168), and if we were also to concede Bagby's postulate (*ibid.*, p. 173) that the 'inventions' of Judaism and Zoroastrianism in or about the eighth century B.C. are to be attributed to the 'Near-Eastern Civilization', on the ground that these 'inventions' were 'premonitory developments prior to the rise of the Near-Eastern Civilization'—an event that Bagby dates some eight hundred years later, in about the first century of the Christian Era. Bagby holds, however, if I have read him correctly, not only that each of the higher religions originated within some single civilization, but also that none of them, at any stage in its history, was anything more than a part of the culture of some single civilization or other. This is implied in his thesis (see *Toynbee and History*, p. 107) that religion is merely a part or aspect of civilization, not a primary agent. In accordance with this thesis Bagby abstains from giving the higher religions any separate place of their own in the morphology of human affairs that he outlines in *Culture and History*. In his view the study of human affairs since the emergence of civilization is wholly covered by 'the comparative study of civilizations' that figures in the sub-title of his book, and he sets himself to fit all six higher religions into this morphological scheme.

being simply part of the Indian Civilization. The other four—Judaism, Zoroastrianism, Christianity, and Islam—are packed into a veritable hold-all for unwanted religions: the hypothetical 'Near-Eastern', alias 'Magian', Civilization that Bagby has taken over from Spengler.¹ The hypothesis that there has been, and still is, a real civilization corresponding to this label is a disputable one. This question is discussed at a later point in the present volume.² Undoubtedly it presents the most difficult of all the problems that confront anyone who tries to identify the civilizations that have arisen so far and to disentangle them from each other. My own attempt to solve this problem by the hypothetical construction of a 'Syriac Civilization' has drawn heavy fire from my critics. In the present volume I am making a second attempt to grapple with this problem,³ and I am in no mood to be censorious about other people's different approaches to it. Anyway, in this chapter we are not concerned with this problem on its own account. We are concerned with it here only in its bearing on the general question of the relations between civilizations and higher religions.

It should be noted that Spengler's and Bagby's system of cultural and social morphology takes for granted their thesis that each of the higher religions is wholly contained within one or other of the civilizations and that each of them is also wholly explicable in terms of its container-civilization. The system and the thesis on which it is based stand or fall together. If Spengler and Bagby found themselves forced, by the historical evidence, to admit that one of the higher religions had, at one or another time and place, been in some relation with two or more civilizations without ever losing its own identity, they would then be bound to admit that this particular higher religion was not, after all, wholly contained in one single civilization and wholly explicable in terms of this. To vindicate the validity of their morphology they must demonstrate either that each of the higher religions has run its course, so far, within the channel of some single civilization's history, or, alternatively, that, if a higher religion has apparently been in relations with more civilizations than one, this apparent historical datum is illusory. What has transcended the limits of a single civilization is merely a common name, with no common substance corresponding to it. The religion associated with each of the two or more different civilizations in question will, in Spengler's and Bagby's view, be found on inspection to be in reality a separate and different religion from any that is associated with any other of these civilizations. Even if it does bear the same name, the common label will prove to be incorrect and misleading.

In *Culture and History* Bagby does not go into this point in his reference to Buddhism,⁴ but in the light of his morphological analysis of Christianity we may assume, I think, that he regards the Buddhism of Eastern Asia (China, Korea, Japan, Vietnam) as being, in effect, a new religion that has nothing beyond the name in common with the earlier Buddhism of India. It is true that every higher religion—Christianity, Buddhism, Islam, or whichever it may be—tends both to retain some-

⁴ On p. 173.

thing of the distinctive colour of the social and cultural environment in which it has originated, and also to take on something of the colour of any other environment into which it may subsequently have made its way. This is to be expected, since the higher religions, whether or not they are 'of' the World, are unquestionably 'in' it, and 'the World' means, in this context, some particular regional culture. But when this has been granted it remains to be proved that the transforming effect upon a higher religion of the experience of entering a new cultural province is so radical as to produce a break with the migratory religion's own past that amounts to a change in its identity.

The test-case for Bagby's thesis, as presented in his published work up to the date of his untimely death, is his analysis of the relations between Judaism, Zoroastrianism, and Christianity and his hypothetical 'Near-Eastern Civilization'. In recognizing¹ that the origins of Judaism go back to the eighth century B.C., Bagby is implicitly identifying it as part of the culture of the Syro-Phoenician civilization that figures² in his list of 'secondary' civilizations. This identification is obligatory if we apply Bagby's own morphological principles. This, however, would involve him in admitting that Judaism had been in relations with more civilizations than one, since he reckons present-day Jews as being partakers in the 'Near-Eastern Civilization'.³ His solution⁴ is to identify the religion of Israel and Judah, from the eighth century B.C. onwards, and Zoroastrianism too, from whatever the date of its origin may be, as 'premonitory developments prior to the rise of the "Near-Eastern Civilization"'. In doing this, he is setting back the origin of the 'Near-Eastern Civilization' itself by 800 years, to the eighth century B.C. from the first century of the Christian Era. This changes his 'Near-Eastern Civilization' from being one that arose *after* the intrusion of the Hellenic Civilization into South-West Asia and Egypt into being one that, like my 'Syriac Civilization', originated in South-West Asia before the intrusion of Hellenism there and survived the millennium of Hellenic domination there that was inaugurated by Alexander's overthrow of the Achaemenian Empire.

I do not quarrel with Bagby for doing this, but I do notice that, as a result of his effort to bring Judaism within the compass of a single civilization, he falls into an inconsistency with himself. A few pages farther on,⁵ in a criticism of my construction of a 'Syriac Civilization', he reasserts the separateness of his 'Syro-Phoenician Civilization' and his 'Near-Eastern Civilization' from each other. In this he may be right; but, if so, his previous modification of his own scheme so as to include his 'Syro-Phoenician Civilization' in his 'Near-Eastern' one, just for the sake of packing Judaism inside a single civilization only, suggests that here he may be forcing the facts; and this suggests, in turn, that the thesis for the sake of which he allows himself to fall into an inconsistency may not stand up to the test of being confronted with the historical phenomena.

This doubt becomes more insistent when we also find Bagby follow-

ing Spengler¹ in treating Christianity in the Western World since the eleventh century of the Christian Era as being a different religion, in spite of the common label, from Christianity in the West before that date and from Christianity elsewhere down to the present day.² This contention is surely a paradoxical one; for surely Christianity, in all its later forms, bears not only a common name but a common character impressed on it by the experiences and achievements of the Christian Church during the first four and a half centuries of its existence. This age—the age of the Apostles, Martyrs, Fathers, Anchorites, and Creeds—has manifestly been the formative one. Compared to the decisive developments that occurred within that period, all subsequent developments in Christianity as a whole or in any of its branches have been no more than minor variations on the original theme; but the manifest formative period of Christianity was over, and the distinctive character of Christianity was firmly set, more than five hundred years before the emergence of the Western Civilization according to Spengler's chronology, which Bagby adopts.

Why then do Spengler, and Bagby following him, exert themselves to prove that Christianity in the West since the eleventh century is a new thing? The explanation is to be found in their inventory³ of the contents of their 'hold-all' civilization: the 'Magian' or 'Near-Eastern', whichever of the two labels may be preferred. This receptacle is so capacious and so elastic that they have managed to pack into it all peoples and communities that have ever professed Christianity down to the present day, with one single, and awkward, exception. After having packed in, along with the rest, the Christians of Western Europe from the conversion of Constantine down to the eleventh century, they have had to recoil from

¹ See Spengler: *Der Untergang des Abendlandes*, vol. i, p. 256. 'The penchant towards the infinite was present in the Northern landscape, in a state of deep slumber, long before the first Christian set foot there; and, when the Faustian soul awoke, it re-shaped both primitive Teutonic heathenism and western Christianity into conformity with its own primordial symbol. It did this just at the time when the German, French, English, and Italian nations emerged, as unities, each with a strongly characterised physiognomy of its own, out of the fugitive forms of the Goth, Frank, Lombard, and Saxon peoples. The Edda has preserved this earliest religious expression of the Faustian soul. It attained its inner completion just at the moment when Abbot Odilo of Cluny initiated the movement that transformed the Magian Christianity of the Oriental-Arab World into the Faustian Christianity of the Western Church. Round about the year 1000 there were two possible ways in which a Faustian religion could take shape. It could either adopt and re-interpret the Magian Christianity of the Fathers or it could develop the Teutonic forms. The Edda is evidence for what the second of the alternative possibilities was.'

² In Bagby's own words (in *Culture and History*, p. 175), Christianity 'was adopted by the Teutonic kingdoms of Western Europe along with a number of other features of Near-Eastern Civilization. When these kingdoms began to develop a distinct major civilization of their own around the beginning of the second millennium, they retained Christianity but modified it profoundly in accordance with their new ideas and values. . . . In accordance with the development of Western Europe, Western European Christianity has been even further modified and has now taken a secular and rationalist cast in accordance with the character of the present age. Though many of the forms of belief and practice, especially among Catholics, are similar to those of Oriental Christians, the spirit—the basic ideas and values—is quite different. . . . To an outsider it must be evident that Christ and his disciples were Near-Easterners, not Western-Europeans.' This last of the points here made by Bagby is certainly correct, but it does not prove that Christianity in the modern West is not still the Christianity that took shape during the first four and a half centuries of the Christian Era.

³ See Spengler: *Der Untergang des Abendlandes*, vol. ii, chap. i B, pp. 49–51, especially p. 50, and chap. iii, pp. 225–399; Bagby, op. cit., p. 167.

trying to do the same with those earlier Western Christians' descendants. The Christianity of Western Europe from the fourth century to the eleventh can be labelled as part of the culture of a 'Near-Eastern Civilization' without creating a startling impression of incongruity. But it would be almost prohibitively incongruous to pack the Westerners of the last nine centuries into the same mixed bag as the Byzantines, Muslims, Armenians, Jews, Copts, Maronites, Parsees, and Nestorians—the more so, when the Abyssinians and the Russians have been tied on to the hold-all's outside.¹

It is hardly possible to label the culture of the modern West 'Near-Eastern'. But, when once it has been conceded that there are two different civilizations—first a 'Near-Eastern' Civilization and then a Western one—with which Christianity has been in relations, it must be argued, on Spengler's and Bagby's hypothesis, that there are two different Christianities—a separate religion to fit into each separate culture-frame. If this is not demonstrated it will have to be admitted that Christianity has been in relations with two different civilizations with no change in its own identity; and this, in its turn, would mean that Christianity is a phenomenon which cannot be classified in terms of any particular civilization and which must therefore be a representative of some different species of society.

This last-mentioned alternative is, I myself believe, the correct conclusion to draw from an examination of the difficulties into which Spengler and Bagby run when they attempt to deal with higher religions entirely in terms of civilizations. I ran into difficulties myself when I was taking the same line, and I concluded from my own experience that I had been on the wrong tack. One's recognition of an error is more convincing when the work in which one detects it is one's own and not somebody else's.

I, too, originally tried to account for the higher religions simply in terms of the civilizations. I took my cue from the relations, as I interpreted them, between the Christian Church on the one side and the Hellenic, Byzantine, and Western civilizations on the other, and I took this set of relations as my 'model' for interpreting the historical roles of other religions of the 'higher' species. I still think that, in the case that I took as my prototype, my interpretation was not incorrect as far as it went; and I think this case does throw some light on the way in which the transition between an earlier and a later civilization takes place when there is an historical connexion between them. At the same time, I now think that I went farther than is warranted by the historical phenomena in applying my prototype case to other cases.²

Following my clue, I saw a higher religion as a mechanism by which the species of society called civilizations had provided for its own repro-

¹ See Bagby, *op. cit.*, pp. 167, 171, 174. In terms of my classification, as revised in the present volume, Spengler's and Bagby's procedure might be salvaged by ruling that the whole of the crop produced by a common Syriac-Hellenic culture-compost (see pp. 446-61) constitutes a single civilization. But this ruling would debar the West from being counted as being a distinct and separate civilization from the rest.

² A reconsideration of my previous procedure will be found in the present volume on pp. 170-86.

duction. I thought of higher religions as being 'chrysalises' into which a disintegrating civilization entered in the last stage of its dissolution, and from which a new civilization subsequently emerged. This view of the historical role of the higher religions was, I now think, a variation on the same fundamental error that I see in Spengler's and Bagby's view. It assumed that the higher religions were significant solely on account of their serviceableness to societies of a different kind from their own.¹ Starting from my own taking-off point, I arrived at different findings from Spengler's and Bagby's over some points of detail. Instead of thinking that a higher religion always originated inside some single civilization, I thought that it always originated from an encounter between two civilizations or more, and that this encounter was always preceded by the breakdown and disintegration of at least one of the parties to it. One of the outward visible signs of social breakdown, as I saw it, was the spiritual secession of a proletariat from a ruling minority that could no longer maintain its dominant position by anything better than sheer force. I saw that in several cases the seceding minority met and mingled with fellow proletarians seceding from some other civilization, and I thought that higher religions were the offsprings of encounters between civilizations at this social level. Seeing Christianity as the offspring of an encounter between the Hellenic and the Syriac Civilization, and judging that both civilizations were in disintegration when this happened, I applied the same formula rightly, perhaps, to the history of the Mahayanian form of Buddhism,² and wrongly, as I am

¹ In retrospect I think that this mistake (as I now believe it to be) in my original diagnosis of the role of the higher religions in history was a consequence of my general outlook at that time. I readily fell into thinking of the higher religions' role as being simply a means towards a non-religious end because I was sceptical about religion in general. This attitude of mine is evidently apparent in earlier volumes of this book; for several critics have noticed it. John Strachey, for instance, in an unpublished critique of vols. i-vi, finds that my arguments for a return to religion are utilitarian and that I come near to thinking that religion is man-made. Lord Hailsham concurs with this criticism of Strachey's in a letter of 4th December, 1949, written to Strachey after he had read Strachey's critique of my attitude. J. K. Feibleman, in *T'ien Hsia Monthly*, vol. xi, Nos. 1 and 2 (1940), p. 146, footnote 10, finds that my argument in favour of otherworldliness is a pragmatic one, on the lines of the fable of Solomon's choice. J. H. Nichols, too, suspects that, in the churches, and indeed in religion in all its manifestations, I see a means to a worldly end. This makes on Nichols' mind an unpleasant impression of utilitarianism, and reminds him of the spirit of the age of the restoration after the French Revolution and Napoleon (*The Journal of Religion*, No. 28 (1948), pp. 99-119; *Stadium Generale*, No. 4 (1951), pp. 175-182, ad fin.).

My original approach to the relation between religion and the secular side of life may, I fear, have given some justification for these criticisms. Since then my attitude has changed, as has been noticed by the critics cited on p. 27, footnote 2, p. 100, footnote 3, and pp. 649-51. If my attitude towards religion was formerly utilitarian, it is not so now. In any case, whatever the judgement on my present attitude may be, I agree that the utilitarian attitude towards religion is a wrong one. Religion is an end in itself, because it is concerned with things that matter more to human beings than anything else in the world. This is the discovery—or revelation—that was the origin of the higher religions. The utilization of a higher religion to serve non-religious purposes is a reversion to a primitive state of affairs in which religion is an integral part of the total configuration of culture. This social reversion seems to me to be also a spiritual regression.

² The Mahayana seems to have arisen in India, contemporaneously with the rise there of the modern form of Hinduism, after there had been an encounter between the Indic Civilization and the Hellenic. This encounter seems comparable to that between the Syriac Civilization and the Hellenic after the overthrow of the Achaemenian Empire by Alexander the Great. India's Hellenic conqueror, Demetrius of Bactria, overran India in and after 183 B.C., just after the Maurya Empire had been overthrown by a usurper.

now convinced, to the history of the worship of Osiris¹—to take, as illustrations, two cases out of a number that I tried to identify, analyse, and interpret. These differences of detail do not acquit me from the charge that, in the earlier stages of my inquiry, I was making the mistake into which, as I now see it, Spengler and Bagby, too, have fallen. The view that I now hold has been exactly expressed by Dawson:

"The great civilizations of the World do not produce the great religions as a kind of cultural by-product; in a very real sense, the great religions are the foundations on which the great civilizations rest. . . . We shall never create a living religion merely as a means to an end."²

Religious faith comes by grace, not by will. Religion cannot be called to heel, like a dog, to suit human convenience.³

At certain times and places living religions have been tempted or driven into serving as means to non-religious ends; but to take these episodes of their history as being their *raison d'être*, as I have done in the past, is to misunderstand and misinterpret their mission. So far from this service of secular purposes being a fulfilment of their mission, it is a diversion from it; and, whenever a higher religion has allowed itself to be shunted into this side-track, there has always been a spiritual-minded minority among its adherents who have remained faithful to their religion's true purpose.

When, in the Roman Empire, the Christian Church was not only granted toleration but was made virtually a department of state, the anchorites withdrew into the Desert, and the Donatists, Nestorians, and Monophysites successively seceded from a church which the Monophysites branded as 'Imperialist' (Melchite). When, in the West, a

The Mahayana played the role of a 'chrysalis' during the interregnum in the history of China that followed the fall of the Han Dynasty at the turn of the second and third centuries of the Christian Era. In this series of events, the pattern of my prototype—the relations between the Hellenic and Syriac civilizations, Christianity, and the Western and Byzantine civilizations—is, I think, recognizable, though perhaps I have exaggerated the points of resemblance between the two episodes. The role of the Mahayana in Chinese history is reconsidered on pp. 176–80.

¹ See further pp. 184–5. Our pictures of the civilizations that have been rescued from oblivion by the work of modern archaeologists are apt to change more rapidly and more radically than our pictures of others—for example, the Hellenic—of which the memory has never been lost and from which we have a large body of surviving literature that gives us not only a record but a key to interpreting this. Our knowledge of the Egyptian Civilization has no such solid body of evidence to stabilize it, and the reading of Egyptian history by the Egyptologists therefore not only changes rapidly but also fluctuates disconcertingly. My original account of the worship of Osiris in i. 141–4 was given on the authority of J. H. Breasted's book *The Development of Religion in Ancient Egypt*, published in 1912. Breasted had been one of the leading Egyptologists of his generation, and in 1930, when I was writing those pages, it was not unreasonable to follow him with confidence. Breasted held that 'the worship of Osiris was a popular religion' (op. cit., p. 29) and that one of the results of its triumph was 'the democratisation of blessedness beyond the grave' (ibid., p. 252). This view of Breasted's has now been discarded by his successors (see, for example, pp. xi–xii of the introduction, dated March, 1959, by J. A. Wilson to a new edition of this book of Breasted's: New York 1959, Harper Torchbooks), and we have no guarantee that their view will stand the test of time any better than his has stood it. Meanwhile, the helpless outsider has to take it from the diadochi that the worship of Osiris was not a popular religion at all. The future opinion of the epigoni is anybody's guess.

² Chr. Dawson: *The Dynamics of World History*, pp. 128 and 168.

³ These points are made by H. J. Morgenthau (in *Toynbee and History*, pp. 198–9), among other people.

resuscitated imperial government tried to reduce the Roman See, and the rest of the Church within its reach, to the state of subordination to which the 'Melchite' Orthodox Church had already been reduced in the East Roman Empire, this secular challenge to the Church's freedom evoked the mighty resistance movement that was carried to a victorious conclusion, under the Papacy's auspices, in the eleventh and twelfth centuries. This was the original issue in the conflict between the Empire and the Papacy. When the Papacy had successfully asserted against the West Roman Empire its claim to be the presiding institution in the medieval Western Christian Commonwealth, its assumption of this quasi-political power provoked first the Conciliar Movement and eventually the Protestant Reformation. The Lutheran and Anglican Protestants jumped out of the frying-pan into the fire. They fell straight into the jaws of autocratic parochial princes; and the Calvinists, where they survived, avoided the fate of becoming the slaves of parochial governments only by resorting to Muhammad's expedient of acquiring political control. After the Anglican Protestant Church had been successfully reduced to subordination by the English Crown, the Church's true role was upheld in England by the secession of the Free Churches from the Establishment. Even in Eastern Orthodox Christendom, where the Church has been deprived of its independence more continuously than in any other part of the Christian World, there has been at least one great country, Russia, in which the movement of non-conformity has been as vigorous as it has been in the English-speaking countries.

Such assertions of a claim to independence, and refusals to acquiesce in seeing the Church being made to serve non-religious purposes, have not been exceptional incidents in the Christian Church's history; they have been vindications of the rule against exceptional breaches of it. The Hildebrandine movement in Western Christendom in the eleventh century was not the inauguration of a new religion. So far from being a breach with the spirit of the primitive Christian Church, it was a revival of this. And the nonconformist movement in Protestantism has not been a flash in the pan. Today England and Scotland are the only English-speaking countries in which there are still established churches; in all the rest, including the United States, all Protestant churches, as well as the Roman Catholic Church, are free from control by the state; and in Russia, since the Communist Revolution of 1917, the boon of hard liberty, that had previously been the dearly-bought privilege of the Russian nonconformists, has been thrust upon the Eastern Orthodox Church by a hostile political regime whose intention, in disestablishing the Church, was, no doubt, not a benevolent one. Through adversity even more than through prosperity, the free churches, Protestant, Catholic, and Orthodox, have been gaining ground in our day, while the established churches have been receding.¹

¹ This is not, of course, the last word on the relative merits of the Christian churches that are carried on the establishments of states and those that are free from this servitude; for the political status of churches is not the only measure of their prosperity and adversity. Another measure—and one which is no less informative—is the average level of the wealth and power of a church's individual members; and the readings on this gauge

The subordination of higher religions to states or other secular institutions is a relapse into the ancient dispensation—prevalent before the first emergence of higher religions—under which religion was an integral part of the total culture of some pre-civilizational society or early civilization. On the other hand the independence re-achieved by the Roman Catholic Christian Church since the eleventh century and, in more recent times, also by the free Protestant and free Eastern Christian churches is in the main line of advance, not only of Christianity itself, but of the higher religions as a class. For example, the establishment of the Shi'i form of Islam as the official religion of a Persian national state in the sixteenth century of the Christian Era has been followed, in the nineteenth century, by two secessions from the Shi'ah in Persia. The Babi movement, and its offspring the Baha'i movement, are missionary religions which address themselves not only to all Shi'is and to all Muslims but to all human beings of all religious denominations.

4. THE LIMITS OF PRESENT POSSIBILITIES OF AGREEMENT

The higher religions are bound always to strive to keep themselves disengaged from secular social and cultural trammels because this is an indispensable condition for the fulfilment of their true mission. This mission is not concerned directly with human beings' social or cultural relations with each other: its concern is the relation between each individual human being and the trans-human spiritual presence, of which the higher religions offer a new vision. We may believe that this vision is an hallucination or we may believe that it is a revelation or discovery of Reality; our choice between these two interpretations of the phenomena will be determined by, and relative to, our fundamental presuppositions. But, whichever interpretation we adopt, we can perhaps agree upon accepting four propositions about the phenomena themselves. The first of these surely uncontroversial propositions is that the believers in the higher religions are convinced that their religious experience is not illusory. The second is that this conviction, whether justified or not, has given them the faith to move mountains. The third proposition is that the deeds which the adherents of the higher religions have done, and the institutions which they have built up, loom large in the panorama of human affairs since the date when religions of this kind first appeared on the scene.¹ The fourth proposition—which has, I hope, been demonstrated more or less convincingly in this chapter—is that, in a study of human affairs, the higher religions cannot be dealt with intelligibly simply as products or parts of particular civilizations.

do not necessarily coincide with those on the other. A politically 'free' church may become the preserve of a privileged class, and may even become an instrument for protecting and promoting this class's worldly interests. The 'free' Protestant churches in the English-speaking countries and the Roman Catholic Church in France have, in our time, become, to some extent, the preserves and instruments of the Western middle class. Conversely, an 'established' church may be a seed-bed, not only for worldliness, but for spirituality. In England, since the Reformation, spiritual prowess, insight, and leadership have not been confined to adherents of the 'free' churches.

¹ But see p. 76, footnote 1.

They require to be dealt with, at least on a par with civilizations and with pre-civilizational societies, as primary phenomena that cannot be reduced to terms of anything other than themselves.

A rationalist-minded student of human affairs can, I believe, accept these propositions, including the fourth of them, without compromising his philosophical position or being untrue to his convictions. Acceptance still leaves open the question whether the unverifiable experiences, from which the higher religions have sprung, are or are not true insights. At the present day we cannot bring our conflicting answers to this question into agreement. This is beyond our power, because these various answers are relative to a still unreconciled difference in our fundamental pre-suppositions about Reality.

Indeed, there is disagreement not only between rationalists and 'trans-rationalists', but also inside the 'trans-rationalist' camp. This domestic disagreement among 'trans-rationalists', is, as I see it, a family quarrel. The differences of view from which it arises are conspicuous, but I do not believe that they are irreconcilable, because I do not believe that they are fundamental. But this, of course, is precisely the point of contention between orthodox adherents of the historic higher religions and ex-believers who have come again to believe that Man is not the highest spiritual presence in the Universe, yet have not returned to this belief in any of its traditional forms.¹ Such agnostic² 'trans-rationalists', of whom I am now one, are perhaps even fewer in number than the rationalists in the present-day world. At present we cannot tell whether one or other of these two present minorities, or the huge present orthodox majority,³ or some other sect, as yet not visible above the horizon, is 'the wave of the future'.

The unclosed rift between orthodox believers and unorthodox 'trans-rationalists' is not, of course, the first schism that there has ever been within the ranks of those who do not find in rationalism a convincing explanation of Reality. There are also the schisms between the different orthodoxies themselves, and these go back to the first appearance of the higher religions on the scene. Each of the Judaic higher religions has always been intolerant of all others, besides being intolerant of religions of the older 'pagan' kind; and this, though tragic, is not surprising; for intolerance is the defect of the higher religions' virtue. The direct

¹ See pp. 75-76.

² I say 'agnostic' (see p. 75, footnote 2) because Father Walker (in *Toynbee and History*, p. 343) and Strachey (in his unpublished critique) are right in their judgement that I do not hold the traditional view of revelation as being a 'release' by God of information telling the truth about Reality in some absolute sense. I believe that the Buddha's experience of enlightenment through His own spiritual exertions was as valid as Muhammad's experience of enlightenment through God's instructions dictated to him by the Archangel Gabriel. If the origin of the experience of enlightenment is divine, it is so, in my view, in a sense in which the same epithet can be applied, with equal truth, to all the rest of our experience. My belief on this point is exactly expressed in the following comment, by one of the contributors to the collected papers of the Hippocratean school of medicine, on the 'Holy Sickness': 'I too hold that these phenomena are divine, but I also hold that everything else is likewise, and that nothing is either more divine or more human than anything else. Each phenomenon has its own nature, and none occurs in any but a natural way' (*Effects of Differences in Atmosphere, Water, and Location*, chap. 22).

³ The orthodox adherents of historic higher religions are still in an overwhelming majority in the World as a whole; in a rather smaller majority in the West; and in a minority perhaps only in Western intellectual circles.

vision of Reality that each of them has caught is so much more convincing and inspiring than the older religions' vision of it that the adherents of each higher religion have jumped to the conclusion that their own religion is a unique discovery, or revelation, of absolute truth and a unique means of salvation. Only the adherents of higher religions of Indian origin have kept their minds open to the possibility that there may be more facets of truth and more ways of salvation than one.¹ The reason why they have remained comparatively tolerant is that they have made less sharp a break than the higher religions of the Judaic group have made with previous forms of religion; for the virtue of 'pre-higher' religion's defects is its readiness to 'live and let live'.²

It is, of course, impossible that each of the higher religions can be right in believing that it has a monopoly of truth and salvation, but it is not at all impossible that all of them should have found alternative roads to salvation and should have seen truth, 'through a glass, darkly', in one or other of truth's different facets. This is what I myself have come to believe. This belief does not necessarily involve the further belief that all the higher religions have seen the truth in equal measure and have found roads to salvation that are equally good. Nevertheless, I fear that Dawson will have been right in his forecast³ that orthodox theologians would find my position unacceptable. A belief in the relative truth and relative saving-power of all the higher religions alike will seem tantamount to unbelief in the eyes of an orthodox believer in any one

¹ In this context Dawson observes, in *Toynbee and History*, p. 135, that the religions of the Indian group and those of the Judaic group are as allergic to each other as oil and vinegar, and that, in the course of history up to date, the acid Judaic religions have been gaining ground at the milder Indian religions' expense.

² The comparative tolerance of the spirit of 'pre-higher' religion is noteworthy, considering that, as we have seen, the dominant divinities of 'pre-higher' religion in its latest phase have been apt to be associated with their worshippers' collective political power, and the parochial states, with which these political divinities have been associated, have by no means been willing to 'live and let live' in their political and military relations with each other. They have habitually gone to war with each other, and these fratricidal wars have tended to become more intense and more devastating until, in the end, all competitors but one have been wiped off the map by a sole surviving victor. It might have been expected that a victorious state would treat the gods symbolizing the collective political power of its conquered adversaries as ruthlessly as it has usually treated the political structures in which this power has been embodied. But, so far from that, the victor, in the age before the rise of the higher religions, has usually shown a prudent discrimination in giving differential treatment to his human enemy and to the enemy's national gods. He has taken it for granted that the enemy's gods, in their domain, are as living and as potent and as legitimately sovereign as the victor's own gods are in theirs; and the military defeat of the human enemy has not, in the victor's view, entailed the consequence that the enemy's gods have either lost their potency or forfeited their rights. A politic victor in this epoch has therefore usually treated the enemy's gods with consideration and even with deference. The Romans, who were past masters in the art of conquest, used to make it their practice, before delivering their final assault on the enemy's military defences, to address an invitation to the enemy's gods to come over to the Roman side, and the invitation was usually accompanied by the offer of attractive terms for admission to the Roman pantheon.

³ In *Toynbee and History*, p. 134, Dawson forecasts that I shall be as unpopular with theologians as I am with historians. J. F. Leddy finds that, though I exalt religion, my form of it is not agreeable to the orthodox (*The Phoenix*, vol. 11, No. 4 (1957), pp. 141-2). K. Löwith finds that I am 'neither an empirical historian nor a good theologian' (*Meaning in History*, p. 14). Anderle reports, in his unpublished paper, that my approach to religion is too lay-minded to suit the theologians' taste, and too theological to be of much interest to the historians, sociologists, and philosophers.

of them.¹ A reverence for them all will seem to him to be what Taylor has nicknamed 'the religion of mish-mash'.²

It is sad to find oneself at variance with fellow human beings with whom one believes—withstanding their contrary belief³—that one

¹ 'To advocate religiousness is one thing; to advocate religious eclecticism is another' (H. J. Morgenthau in *Toynbee and History*, p. 197). As a result of not rejecting any of the religions, Toynbee remains outside them all. 'Toynbee is sensitive to the word of God in so far as it has become historically tangible in dogmatic symbols and ecclesiastic institutions, but... he does not hear the word as spoken to him personally' (E. Voegelin in *The Intent of Toynbee's History: A Cooperative Appraisal*). The Rev. E. R. Hardy Jr. is, I think, making the same point as Voegelin when (ibid.) he judges that, 'in the religious field, Toynbee is not sufficiently aware of his own limitations'. L. C. Stecchini (in *Midstream*, Autumn, 1956, pp. 84-91) points out that the 'essence' of Christianity, as I see it, is, in effect, the element that Christianity has in common with the Mahayana. Dawson (in *Toynbee and History*, pp. 134 and 130-1) finds my notion of 'philosophical equivalence' even more questionable when applied to higher religions than in its application to civilizations. As Dawson sees it, 'it is necessary to accept the Christian faith in order to understand the Christian view of history, and those who reject the idea of a divine revelation are necessarily obliged to reject the Christian view of history as well' (*The Dynamics of World History*, p. 235). I agree. Löwith (op. cit., p. 16) points out that I do not see history in its Christian framework (e.g. B.C.-A.D.).

In Dawson's opinion (*Toynbee and History*, loc. cit.), I am arguing that the living higher religions are identical with each other and in thus arguing, I am forcing the evidence. I agree that I should be forcing it if I were, in truth, arguing what Dawson thinks I am. On this point, he has not caught my meaning—I am sure, not through his fault but through mine, for having failed to express myself clearly enough. I do believe that all the higher religions, and, indeed, religions of all kinds, have in common an inkling of an identical truth about Reality and of an identical goal of salvation for human beings. But I do not hold that the religions themselves are identical; and, for as far into the future as we can see ahead, I do not expect that they will agree to make a merger of their different doctrines, practices, and institutions, in which their common spiritual treasure is diversely presented.

² A. J. P. Taylor in *Toynbee and History*, p. 117. Taylor's disapproval of my catholic piety towards the historic higher religions seems inconsistent with his accusation that I lack 'the historian's characteristic piety towards the past' (see footnote 4 to p. 66).

³ e.g.: 'Toynbee does not mean what the Church means at all' (Father L. Walker, O.P., in *Toynbee and History*, p. 341). 'It is necessary... to stress the radical unorthodoxy of Toynbee's position in terms of any of the established sacramental Christian churches' (Crane Brinton in *The Virginia Quarterly Review*, vol. 32, No. 3 (Summer, 1956), pp. 361-75). In *Wissenschaft und Weltbild*, 2. Jahrgang, Heft 4 (October, 1949), pp. 268-9, F. Engel-Janosi maintains that my dualism—as revealed in my adoption of the myth of God's encounter with the Devil—is incompatible with Christian doctrine. The idea that God needs the Devil's help in order to create is not compatible with the idea of creation *ex nihilo*. I think H. Baudet is making the same point in *Historie en Metahistorie*, p. 53, when he says that I have 'historicised', 'biologised', and 'secularised' an antique piece of mysticism by turning the Devil into a ubiquitous insect: i.e. into Nature trying to reassert herself against culture. In the same passage Baudet also says that I have replaced God by the Christian Church, 'which is of greater practical use in virtue of its social qualities, on which' I lay 'so much stress'. J. H. Nichols, too (see the *Journal of Religion*, No. 28 (1948), pp. 99-119, on pp. 118-19, and *Studium Generale*, No. 4 (1951), pp. 175-82, on p. 182) finds that I identify the Kingdom of God with the Church and thereby reduce Christianity to ecclesiasticism. R. L. Shinn finds that 'Toynbee's dangerous ecclesiasticism threatens to subdue his deeper insights' (*Christianity and the Problem of History*, p. 241). Toynbee, contrary to his intentions, sometimes mistakes a universal church for religion, the institution for the spirit (M. C. Swabey: *The Judgment of History*, p. 223). In T. A. Sumberg's view, in *Social Research*, vol. 14, No. 3 (September, 1947), pp. 267-84, 'some of the insidious virus of modern paganism has penetrated the soul even of our modern historian'. Father G. F. Klenk, S.J., in *Stimmen der Zeit*, No. 145 (1949/50), pp. 376-84, on pp. 382 seqq., demurs to my explaining the rise of Christianity as a natural event—a result of syncretism—and thereby wiping out Christianity's supernatural character. Joynt remarks that 'in some ways the Toynbee view of the meaning of history is odd even by theological standards. The traditional Christian view is that the ultimate meaning of history is eschatological, i.e. it lies beyond itself. Toynbee claims to have used empirical methods, and produced not only "laws of Nature" but "laws of God" as well. In other words, the ultimate meaning of history is to be found in history. In this conception the Deity becomes almost entirely immanent and loses all transcendent qualities' (*The Australasian Journal of Philosophy*, vol. 34, No. 3 (December, 1956),

is really in agreement over the heart of the matter at issue. But I am anchored in my present moorings by two convictions that will not let go of me. I am convinced that the spiritual presence that is higher than Man is merciful and compassionate¹ in Its aspect in which It presents Itself to us as a person and in which we see It as God. And I am convinced that every human being is capable of catching a vision of the trans-human presence and of entering into communion with It, whether he finds It in Its personal aspect as Brahmā or in Its impersonal aspect as Brahman or as Nirvāna. Each of these two convictions can stand by itself; yet though they are independent they give each other mutual support; for each of them implies the other; so, if either of them is a true insight into Reality, the other cannot be a delusion. Together they give, for me, an assurance that the presence behind the phenomena is not capricious, and that the capacity to enter into communion with It is of the essence of human nature. I therefore believe that there never has been, and never will be, a 'chosen' people or sangha or church invested with a monopoly of truth and salvation. Any such monopoly, if it were conceivable (and it is not conceivable to me), would be invidious both for the recipient and for the donor of the privilege. It would not be consonant either with Man's nature or with God's nature as I see them. And, as long as I continue to see them as I do, I shall also continue, as

p. 201). Brinton in loc. cit., and J. H. Nichols, in *Studium Generale*, No. 4 (1951), p. 182, find that I am a Pelagian. The Rev. E. R. Hardy Jr. finds that I am a semi-Pelagian (*The Intent of Toynbee's History: A Cooperative Appraisal*).

If the reader cares to compare the passages cited in this footnote with those cited on p. 27, footnote 2, p. 94, footnote 1, and pp. 649 and 656), he will see that my attitude and beliefs in regard to religion have been criticized, on a number of points, on grounds that are not merely different from each other but are diametrically opposite and are therefore presumably incompatible. I have been classified as being both a Pelagian and an Augustinian. I have been censured both for seeing God as more immanent and for seeing Him as more transcendent than is right in the critic's judgement. My attitude has been denounced as being both unduly 'otherworldly' and unduly 'thisworldly'. I have been charged both with valuing religion for utilitarian purposes and with denying value to the secular and material side of human life except in so far as this serves as a means to religious and spiritual ends. In H. E. Barnes's eyes I am 'a devout Christian mystic', and my 'imagination is primarily centred on the second coming of the Lord under Anglican auspices' (*An Introduction to the History of Sociology*, pp. 718 and 736). More discerningly, the Rev. E. R. Hardy Jr. finds that my interpretation of world history is, in the last analysis, a devout one, but that, 'from the Christian point of view, the trouble with Toynbee's "true religion" is that it is too purely spiritual' (*The Intent of Toynbee's History: A Cooperative Appraisal*).

Some of these mutually contradictory criticisms seem to cancel each other out. In so far as they do not, this must mean that there are inner contradictions in my position, or in my critics' positions, or in both. My position has certainly changed while I have been writing this book (see p. 27 above, and pp. 649-51 below). I have also, perhaps, been imprecise, in places, in setting out what my position is. At least, several critics have taken me to task on this account. I can only say that I am neither orthodox nor rationalist, and that my 'trans-rationalist' position, between these two poles, is clear to me, at any rate. In any case, whatever light my critics may or may not have thrown on my position, they have thrown much light, I should say, on a far more interesting point. They have brought out the truth that, at the present time, the Western World is a house divided against itself on the fundamental issue of religious attitude and belief.

I am all the more grateful to E. I. Watkin for the concluding paragraphs of his review of vols. iv-vi of this book in *The Tablet*, 12th August, 1939. 'Professor Toynbee's book', he generously writes, 'is a challenge to us [Catholics]. . . . Rather, it is the challenge, not of this book, which does but display it, but of history itself. . . . May he communicate to the readers of his . . . work the vision he has seen with the faith and hope which it inspires.'

¹ 'Misericors et miserator Deus'; 'Allāh ar-Rahmān ar-Rahīm'. This testimony from the harsh Judaic religions is impressive.

far as I can foretell, to remain in the theological position in which I now find myself.

This stand of mine may put me out of communion with the orthodox adherents of each of the higher religions (at any rate, each of those in the Judaic group). It lies with the orthodox, not with me, to decide whether, in their eyes, I am within their pale or am beyond it. But it lies with me, not with them, to feel the feelings that I, too, feel towards those sublime figures that are revered and adored by me as well as by their orthodox followers or worshippers. No human writ of excommunication can come between those saviours and me. My knee bows, like every Christian's knee, at the deed of self-sacrifice, done for love of us men and for our salvation, that is recited by Saint Paul to the Philippians.¹ For me, the doer of this deed is one presence in more than one epiphany. It is Christ, and, because it is Christ, it is also the Buddha and the bodhi-sattvas.

B

RECONSIDERATIONS OF STRUCTURAL PROBLEMS

IV. THE PROBLEM OF QUANTITY IN THE STUDY OF HUMAN AFFAIRS

I. THE INEFFECTIVENESS OF TEAM-WORK IN INTELLECTUAL OPERATIONS

THE problem of quantity arises in the study of human affairs because it besets all intellectual inquiry, whatever the field. It is a consequence of the conjunction, in the structure of human minds, of two inescapable limitations. A mind has to operate by the method of analysis and classification, because it has no other method at its disposal. A mind has also to do whatever it is going to do within a single lifetime, and, what is more, within that span of it in which the mind is neither infantile nor senile. Thinking by means of analysis and classification takes time, and the process of apprehending Reality in this way breaks up the undifferentiated unity of the mystical experience into an innumerable host of phenomena. The quantity of the phenomena is out of all proportion to the capacity of any single mind to deal with them in a single working lifetime. *Ars longa, vita brevis*. This lapidary statement of the common human experience of the mind's inadequacy for carrying out its ambitious enterprises comes from the pen of an Hellenic student of medicine.¹ As soon as people began to try to make a systematic study of any fraction of the boundless field of the phenomenal universe, they found that they had set themselves Psyche's task.

Cannot her task be accomplished, and the problem be solved, by co-operation? Though the phenomena may be innumerable, human beings, too, are numerous—even though the number is limited, for practical purposes, to the roster of living participants in some particular society. Man is a social animal; co-operation has become a second nature to him; and, though practical co-operation has hitherto been limited to fractions of the whole living generation of mankind, it has nevertheless done marvels. Team-work has been the means by which Man has accomplished his enormous achievements in technology, economics, politics, war, and even religion on its institutional side. Could Man not obtain comparable results by resorting to the same device in other activities? The answer is that, up to now, creative acts in the fields of thought, art, and the personal side of 'higher religion' (as defined in this book) have been the achievements of single minds; and we do not yet know whether, in these fields, team-work is or is not

¹ ὁ βίος βραχύς, ἡ δὲ τέχνη μακρή (Hippocrates: *Aphorisms*, i. 1).

possible. As far as we know at present, only single minds can think thoughts and express them. The squads, gangs, crews, and committees that have done, and are doing, so much of the World's work have never yet succeeded in doing this part of it. There have never been such things as collective thinking and collective writing. Any document that purports to be the product of a committee will prove—if it makes any genuine contribution to knowledge and understanding—to be the unacknowledged work of some anonymous single draftsman.¹ Accord-

¹ 'As every person with experience of committee work knows, its fertility is limited to what the best mind among its members can master; if the results of the discussion are not ultimately turned into a coherent whole by an individual mind, they are likely to be inferior to what would have been produced unaided by a single mind' (F. A. Hayek: *The Counter-Revolution of Science*, note 82 on p. 218). This is also my own considered belief. It was the starting-point of this book, and, on reconsideration, I find myself as firmly convinced of its truth as I was in 1925, when I wrote what are now the first pages of vol. i. I have been encouraged by finding that I share this belief with Father M. C. D'Arcy. Team-work, Father D'Arcy, too, holds, 'can never take the place of the great historian' (*The Sense of History*, p. 57). This is, however, a controversial belief, and my declaration of it in i. 4 has drawn the following comment from Sir George Clark in a paper on 'The Origin of the Cambridge Modern History' in *The Cambridge Historical Journal*, vol. viii, No. 2 (1945), pp. 57-64. 'The more we regard historical study as a methodical search for truth, the reader we must be to dispense with the smooth readable continuity which only an individual author can give to a whole work; and, if we look at *The Cambridge Modern History* from this point of view, we shall be impressed, not by the splitting up of the work among many authors, but by their thoroughness. The system is the exact opposite of industrialism; each writer made a fully articulated and finished piece of history which might have been published by itself. They worked like medieval craftsmen, some of them even grinding their own colours' (p. 58).

I agree, of course, with Sir George Clark's account of what has been achieved in *The Cambridge Modern History*—as well I may, considering that he is making my point for me. What he and I are both saying is that historical thought, like all thought, is the work of single minds, and that, when you put a number of minds to work on different sections of some epoch of history, what you get is a number of separate self-contained pieces of work—so effectively self-contained and separate that (to repeat Sir George's words) each piece 'might have been published by itself'. What you do not get by this division of intellectual labour is an organic whole in which the individual writers' contributions fall into place as integral parts of a unified structure. Each of the contributions may be a unity in itself, but they do not make a unity when they are strung together. Sir George's contributors are like performers in an orchestra who have each played a tune of his own, instead of executing an allotted part of some work by a single composer. As I see it, structural unity is the property with which the editors and writers of *The Cambridge Modern History*, and other symposia of the kind, have been ready to dispense, and in my view this readiness is a serious error.

In a work of thought, as in a work of art, of architecture, or of engineering, structural unity ought, I should say, to be one of the chief objectives, and this not only because it is an important end in itself, but even more because, in default of it in an intellectual enterprise, it is probable that some of the most important issues, problems, questions, and topics that ought to have been under consideration will have been passed over. This is likely because the most important points are usually general points. These do not come into view unless one takes a comprehensive survey of the whole field; and this is what will be lacking in a volume that is not a book but is an assemblage of booklets, each of which might just as well have been published separately. This point has been made by Polybius in the passages quoted here on p. 138, footnote 2.

For this reason I am not ready to dispense with the structural unity that can be produced only by a single mind (as is illustrated by the fact that each of the contributors to *The Cambridge Modern History* has successfully made a structural unity of his own contribution). I am as ready as Sir George and his contributors are to dispense with 'smooth readable continuity', and I am impressed, as Sir George is, by 'the laboriousness, the "factual" knowledge', and 'the mechanical skill' of the contributors (I am repeating the words that I used in the passage that he cites). But I am still more impressed by the inability of an intellectual engineering enterprise to achieve, by team-work, the result that mechanical engineering enterprises do achieve by it. A product of mechanical engineering team-work—a bridge, dam, liner, battleship, or skyscraper—is a structural unity. In work done by an intellectual team, the contributions of the single minds do not produce a structural unity, as Sir George himself points out.

The reason for this difference between the two results is to be found, I believe, in a

dingly, for as far as we can see ahead, the problem of quantity in intellectual work will continue to be one with which single minds must grapple as best they can. The enterprise courts failure and therefore requires audacity. In this field audacity is a virtue, not a vice. It does not, in itself, convict the intellectual adventurer of the self-centred sin of *hybris*. Being human, he may, of course, fall into this. But in plunging into the jungle he is performing a perilous public service. For the problem of quantity in intellectual inquiry is one that is not just personal to the inquirer; it is one of the important problems of society; and society's need to see this problem faced, and, if possible, solved, is a need that, at least for the present, only single minds can meet.

2. THE INORDINATE INCREASE IN THE QUANTITY OF INFORMATION ABOUT HUMAN AFFAIRS

The problem of quantity in intellectual inquiry is as old as human society itself. A society is a network of relations between individual human beings, and, even in the smallest and simplest society, the quantity of these relations is innumerable. Moreover, an individual human being is not 'individual' in the literal sense of being an unfissionable psychic unit. A personality is a network of relations between psychic events, and the quantity of these relations, too, is innumerable. So the intellectual problem of quantity has always been there. It has not, however, always been so strikingly and formidably manifest as it is in the present-day world. It is true that, at all times and places, including the present, the best-informed and wisest individual's knowledge and understanding of the phenomena, within his own psyche and outside it, is infinitesimally small compared with the infinite quantity of the myriad things that are demanding to be known and understood. But it is also true that, for practical purposes, the range of an individual's ignorance and knowledge is relative not so much to the infinite extent of the whole potential field as to the actual range of ignorance and knowledge in the culture in which this particular individual happens to partake. The extent of this common store of knowledge that is at the individual's disposal is, of course, like the extent of the individual's personal knowledge, always infinitesimal by comparison with the extent of mankind's universal and perpetual ignorance. At the same time, it varies enormously as between different cultures, and, within a single culture, as between its different phases, by comparison with the maximum capacity of an individual mind. This variability of the extent of the common store of knowledge is a point of great practical importance, because a society's common store of knowledge 'only exists in the dispersed, incomplete, and inconsistent

difference in the meaning of the word 'team' in the two contexts. The same word is being used as the label for two quite different social structures. An editor's 'team' is a number of independent creators; an engineer's or architect's team is like a composer's orchestra: it is a number of disciplined executants, each playing his allotted part in the performance of a piece previously composed by a single mind. Even the clerk-of-the-works, *alias* conductor, is merely an executant-in-chief. An editor's 'team' are not executants of the work of a single mind; each man is his own composer and is the executant of his own separate piece only.

form in which it appears in individual minds';¹ and it becomes coherent and consistent only in so far as some single mind succeeds in comprehending and unifying it.

If we may use the terms 'knowledge' and 'ignorance' in the second, and more practical, of the relative usages of their intrinsically relative meaning, it would be true to say that, in most societies at most times up to date, relative omniscience has not only been possible; it has been a normal attainment of any mind whose cumulative acquisition of knowledge has not been cut short by an early death. As Marcus Aurelius puts it,² 'any man of forty who is endowed with moderate intelligence has seen—in the light of the uniformity of Nature—the entire past and future'. This dictum was hardly true of the Hellenic World in Marcus's own day. Marcus himself, as his writings reveal, was the heir of a culture that, by his time, had been accumulating experience and knowledge over a period of more than twelve hundred years. Marcus's dictum would have been truer of the pre-Hellenic cultural interregnum. Relative omniscience will have been within men's reach in an age in which the art of writing in the Minoan scripts had been lost, and in which the Hellenes had not yet learnt the use of the Alphabet from the Phoenicians. Relative omniscience came within reach, again, during the post-Hellenic cultural interregnum in what, in Marcus's day, had been the western provinces of the Roman Empire. This time, it is true, the art of writing was not lost even in this culturally backward western penumbra of the former Hellenic World. But the common store of culture did dwindle, here and then, to a compass that made it possible for an individual to master the whole of it; and here it was some time before the achievement of this relative omniscience was made impracticable once more by the gradual rise of the Western Civilization. The whole of the common store of Western knowledge could still be known in the eighth century of the Christian Era by Bede and Alcuin, and almost the whole of it, even as late as the thirteenth century, by Saint Thomas Aquinas and Dante. We present-day Westerners, however, like the Hellenes in Marcus's day, have at our disposal a fund of experience and knowledge that has been accumulating for more than twelve hundred years, and this present-day Western fund is also at the disposal of the whole human race, since the Western Civilization has now grown to a stature at which it is offering itself as an initial framework for a future world-wide culture. So, today, both in the West and in the World as a whole, the individual once again finds himself living in the times of ignorance, in the sense that, in the present-day world, the common store of knowledge is vastly greater than the maximum that an individual can assimilate. In this sense a problem that is universal and perpetual is also peculiarly ours. In our case it has been aggravated to a degree that is perhaps without precedent.

This increase in the amount of what there is to know is overwhelming, even if we confine our horizon, for present purposes, to the field of human affairs. This dichotomy between what is human and what is

¹ F. A. Hayek: *The Counter-Revolution of Science*, pp. 29–30.

² Marcus Aurelius Antoninus: *Meditations*, Book XI, chap. 1. Cp. Book VII, chap. 49.

non-human has, of course, always been arbitrary. Its arbitrariness is being shown up in our time by the rapid advances in the two sciences of psychology and biology. Advancing from opposite quarters, they are bridging the traditional gulf between soul and body, spirit and matter, organic and inorganic, animate and inanimate; and they are already pointing towards a future stage of understanding in which it will no longer be intellectually tolerable to diffract the concrete unity of psychosomatic phenomena. In fact, a day is now in sight at which the minimum 'intelligible field of study' will be nothing less than the whole of the phenomenal world in all its aspects.

Meanwhile, in the present psychic as well as in the present physical province of knowledge, there has been a sudden revolutionary increase in the quantity of data as the result of a great feat of analysis. The word 'individual' means in Latin what the word 'atom' means in Greek. It means a unit that cannot be subdivided and that therefore offers a solid foundation for research into the structure of the Universe. In our time this once supposedly solid ground has given way in both provinces of knowledge. While the physicists have been splitting 'atoms', the psychologists have been analysing 'individuals'. In both fields the former basic unit has been found, not merely to be fissionable, but to be a universe in itself: a microcosm that is as complex as the macrocosm built of hosts of these miniature worlds. The material atom has been proved to have an internal structure resembling a solar system, and the human individual to have an internal structure resembling a society. Like a society, an individual is a network of relations, and the individual's internal psychic relations have, in common with his external social relations, the awkward property of being innumerable.

This is not, of course, a new state of affairs; it is not even a new discovery. In the Indic World in the sixth century B.C. the Buddha made the discovery that the supposed indivisibility of an 'individual' personality was an illusion. With the discerning eye of intuition, He diagnosed a personality as being a fleeting series of innumerable successive psychological states. Each of these states, as He saw them, was discontinuous with both its predecessors and its successors. Two forces, and two only, held them together: the wind of desire, which drove them along in company like a herd of hurrying cloud-racks, and the load of *karma*—the cumulative balance of the self-recording moral profit-and-loss account to which desire gives rise in its vain attempt to satisfy itself. Modern Western psychology, approaching its subject of inquiry by the circuitous route of analogy from the procedure of modern Western physical science, has arrived at the Buddha's discovery about 2,400 years after the date at which the Buddha achieved it intuitively. Buddhists and modern Western psychologists agree in seeing the internal psychic structure of an individual human personality as a network of relations between innumerable psychic events and in finding that this net has some kind of structural pattern. But the objectives of these two schools of inquiry have been widely different, and consequently an identical discovery has not had the same effect, in the two cases, on the intellectual problem of quantity.

The Buddha's aim was austerely practical. He had no inclination to count or measure or classify the psychic cloud-racks; and He had no inclination, either, to study the texture and pattern of their relations with each other except to the minimum extent necessary for dissipating them. He was convinced that they could be dissipated by strenuous spiritual exertions, and He prescribed a plan of operations, based on His own spiritual experience and achievement. The goal was the liquidation of *karma* and the extinction of desire, and the reward for attaining it was that it would bring with it an exit from sensuous life into a state of 'extinguishedness' (*Nirvāṇa*). The spiritual residue, after the flame of desire had burnt out, would be immune from the malady of reacquiring personality in the form in which we know it, since it would be immune from being born again into this world. The Buddha's paramount concern, after His enlightenment, was to teach His fellow sentient beings the way of release that He had found for Himself. Since the way was hard and forbidding, He was vigilant in seeing to it that His disciples should not find excuses for diverging into easier paths. One insidious temptation, for which He was always on the look-out, was that of yielding to intellectual curiosity about the psychic landscape that was the setting of the spiritual enterprise on which He and His disciples had embarked. In the Buddha's eyes such curiosity was no better than camouflaged escapism, and He always firmly refused to satisfy it. His attitude towards knowledge was like that of a present-day Western civil servant, not like that of a present-day Western professor. The information that He gave about the fleeting psychological states and the way of release from them was the minimum amount needed for taking the necessary action. Accordingly, His discovery of the individual human being's inner psychic universe did not lead, in His world, to any revolutionary increase in the amount of what there was to know.

In the present-day world, on the other hand, the repetition of the Buddha's discovery has brought with it a revolutionary expansion of the intellectual horizon, because the aims and methods of modern Western psychologists have been unlike the Buddha's. The purpose that has inspired them has not been to help a human personality to extinguish itself; it has been, on the contrary, to help it to keep itself in psychic repair for the term of its natural life. The only things in common between this aim and the Buddha's are a disinterested compassion for the sufferings of fellow human beings and a benevolent concern to bring them relief. But, since there is a polar opposition between the Buddha's conception and a modern Western psychologist's conception of what it is that suffering souls need to be relieved of, it is no wonder that the two schools should have put an identical psychological discovery to entirely different uses. Since the modern psychologist's prescription for getting rid of suffering is not the radical Buddhist remedy of getting rid of oneself, but the mild palliative of preserving oneself by getting rid of one's psychic disorders, the modern psychologist is eager to know as much about the psyche's inner universe as possible. The maximum, not the minimum, amount of knowledge is what he needs for the pursuit of his un-Buddhist objective; and the duty of acquiring as much knowledge of

his subject as he can is enjoined upon him, not only by his approach to the practical problem of suffering, but also by his scientific method of work, which he has taken over from the older branches of modern Western science that are concerned with non-human nature. The modern Western school of science has been led by its experience to take up an attitude towards intellectual curiosity for its own sake which is the inverse of the Buddha's attitude. So far from looking on curiosity as a specious excuse for shirking present practical tasks, modern scientists look on it as a key to future practical successes; and this favourable view of theirs has certainly been justified by their experience during the last three centuries.

For these reasons the rediscovery, in our time, of the individual personality's inner psychic universe has already had the effect of vastly extending the range of what there is to know about human affairs. If it were practicable to make an exhaustive record of all the psychic events, sub-conscious and conscious, emotional and intellectual, that are now known to take place in a single psyche within the shortest span of time that a human mind can register, 'the World itself could not contain the books that should be written'.¹

While there has been this revolutionary increase, in our time, in the quantity of things to know about Man's psychic microcosm, there has also been a contemporaneous increase in the quantity of things to know about his social macrocosm. Indeed, the increase in this field, too, would have been sensational if the increase in our knowledge of the psychic universe had not put it in the shade. The multiplication of the volume of social data has been proceeding rapidly in several directions, and in all these directions it has been due to one or other of the many consequences of the unprecedented technological advance of the Western Civilization in its recent 'late modern' and its current 'post-modern' age.

One of these consequences has been to give the Western peoples an ascendancy over the rest of mankind. This ascendancy has been something abnormal, and it now looks as if it were going to be no more than a temporary episode in the World's history. But transitory events can produce lasting effects, and one effect of the recent world-wide Western ascendancy has been to knit together the whole habitable and navigable surface of the planet, with the air above it, into 'one world'. This effect seems likely to last, because it is a product of the Western technological achievement of 'annihilating distance'; and Western technology, unlike Western domination, does not look as if it were going to be ephemeral. So far from that, it looks as if it were going to become a common possession of the whole human race. This knitting together of all mankind into a single world-wide society is still only in its early stages. But already it has produced a vast increase in the amount of things to know about human affairs.

In the past, until quite recent times, a human being's horizon was more or less closely confined to the particular civilization in which he happened to have been born and brought up. Even if he had become

¹ John xxi. 25.

one of a small highly educated minority, the classical education that was the standard form of higher education in most civilizations till the other day would have expanded his horizon in the time dimension only. He would have acquired some familiarity with the culture of his own society in some earlier phase of its history, or with the culture of some earlier society to which his own was affiliated. This historical background might have been broadened and deepened if the civilization in which he was a participant had grown up under the aegis of one of the higher religions. He would then also have been instructed in this religion's tenets and history. But he would still have remained more or less ignorant of the rest of the contemporary world outside his own civilization and his own religion, and also ignorant not only of the present characters but of the historical backgrounds of the other civilizations and higher religions—not to speak of the pre-civilizational cultures—among which the rest of the human race was distributed. At the other extreme, if he happened to have been born and brought up in a society that was still in the pre-civilizational stage, his intellectual horizon would, of course, have been far more narrowly circumscribed than that.

This traditional state of mutual ignorance had at least one important intellectual advantage for human minds. It set some limits to the quantity of things to know. But these limits have been swept away by the revolutionary unification of the World as a consequence of its Westernization. One section of mankind after another has been constrained, by this levelling of previous barriers, to widen its mental horizon to embrace the whole World.

The first to be affected have been the people in leading positions in the non-Western civilizations. The force of the West's impact has compelled them to acquaint themselves with Western technology, Western languages, and, to some extent, also with Western manners and customs. They have had to do this if their country has been subjugated by some Western state, because they have had to accommodate themselves to the alien ways of their new Western rulers. But they have had to do the same if they have saved themselves from falling under Western rule and have been bent on continuing to preserve their independence; for the West's technological superiority has been so manifest, and has also so manifestly been the cause of the West's military and political ascendancy, that it has quickly become obvious that the only effective way of resisting the West is to do it with Western weapons, spiritual as well as material. This has meant, not merely acquiring these weapons, but also learning how to use them, service them, and make them; and that, in turn, has meant serving an apprenticeship in Western arts. Sooner or later it has become apparent that these arts cannot be mastered if one approaches the task from a narrowly utilitarian point of view. To acquire the Western art of war involves acquiring one element of Western culture after another, until the only practicable course comes to be the adoption of the Western Civilization in its entirety. This bitter pill may be sweetened by labelling the importunate alien civilization 'modern' instead of 'Western', and coming to look upon it as a common achievement and possession of all mankind rather than as something

imposed, either directly or indirectly, on the majority by an all-powerful Western minority. Whether sweet or bitter, the pill has had to be swallowed. It has been no more possible for non-Western diehards to reject the Western Civilization than it has been for non-Western defeatists. This Westernizing movement in the non-Western World began among the Eastern Orthodox Christian peoples—Greeks, Serbs, Rumans, and, above all, Russians—towards the end of the seventeenth century, in the generation of Peter the Great. During the quarter of a millennium that has elapsed since then, the movement has gathered momentum and has become world-wide. By now it would be near the truth to say that there is no longer any living society, however primitive, that has not been drawn into the Westernizing movement, at least to some extent.

This Westernizing movement among the non-Western majority of mankind has had its counterpart among the Western minority in an impulse to learn something about the rest of mankind. This movement in the inverse direction has been slower in getting under way. In any encounter between parties that are signally unequal in strength, the weaker party always has to come on to the stronger party's ground faster and farther than the stronger party finds it necessary to come on to the weaker party's. As the West progressively loses its temporary ascendancy, we may expect to see its approach towards the rest of the World gain in impetus.¹ Meanwhile the West has already gone far in making itself acquainted with the non-Western societies and their cultures. It has been impelled partly by practical needs; for the stronger party, too, has to know at least something about the party with which it is dealing. Without some knowledge of its weaker neighbours, it cannot trade with them or govern them or even make war on them efficiently. Such practical considerations, however, have been notably reinforced, in the West, by a disinterested intellectual curiosity that has been one of the cardinal virtues of the modern Western scientific movement. This curiosity has inspired a distinguished company of Western Orientalists, Americanists, and anthropologists. Between them they have won for the West an increasing knowledge of the higher religions (which are all Asian in origin), the non-Western civilizations of the Old World, the pre-Columbian civilizations of the Americas, and the surviving pre-civilizational cultures all over the globe. The West's own store of knowledge has naturally been the first to be increased by this Western intellectual enterprise. But the new knowledge of non-Western religions and cultures that the West has won has quickly become the common possession of all men and women who have had a higher education on Western lines, including the Westernizing element among the leaders in the non-Western societies. In our generation some of these Westernizers are already looking at their own civilization and its historical background with new eyes, and are making original contributions

¹ Already, in Great Britain today, Oriental studies are being supported financially out of the public purse on a markedly more generous scale than in the days when what are now the independent states of India, Pakistan, Burma, and Ceylon were being garrisoned by British, or British-officered, troops and were being governed by British officials in the higher ranks of the administrative hierarchy.

to the study of it by Western methods. Even Chinese scholarship, which has a critical tradition of at least two thousand years' standing, has probably gained much by adopting modern Western critical methods as a second string to its bow.

Thus, by our day, a knowledge of all the living religions and cultures and their backgrounds has become accessible to all 'modern-minded' people in all parts of the World.¹ This world-wide panorama of human affairs, which is now accessible to everyone, had not been within anyone's reach before. But the widening of our new common horizon in the field of human affairs has gone still farther than this. The new knowledge acquired by the Orientalists, Americanists, and anthropologists has reached back into the past no farther than the farthest reach of the living societies' unbroken traditions. But, in the meanwhile, the archaeologists have been acquiring knowledge of 'dead' civilizations that have no living heirs to keep their memory green.

Some of these 'dead' civilizations had been lying in complete oblivion for centuries or millennia, until modern Western archaeological enterprise brought them to light again. Others had been known to have existed without being known for what they really were. Memories of them had survived in second-hand accounts of them that were so ill-informed as to be misleading; or the remains of their monuments, still standing above ground, had gathered round them legends that were screens for ignorance. The retrieval of these long-lost civilizations was begun in earnest by the French scholars who accompanied Napoleon in his invasion of Egypt in 1798. Within the subsequent century and a half, archaeological excavations, conducted with ever greater technical skill, have thrown floods of light on the Egyptian and Sumero-Akkadian civilizations, which had always been known of at second hand through the Bible; on the Hellenic Civilization, which had been far better known through the continuous currency of a surviving remnant of its literature; and on the pre-Columbian civilizations of Middle America and Peru, whose last phases had been placed on record by the Spanish conquerors who put an end to them.² But archaeology has made still greater additions to knowledge by disinterring civilizations of which only the faintest memory, if any, had survived: for instance, the Hittite Civilization in Anatolia; the pre-Hellenic Minoan-Helladic-Mycenaean Civilization in the Aegean; the pre-Aryan Indus Culture in North-Western India; the pre-Chou Shang Culture in Northern China.³ These archaeological additions to knowledge have also become the common possession of

¹ A. L. Kroeber points out that the whole contemporary and whole past world of art is now playing upon each single field of contemporary regional art (*Style and Civilizations*, p. 50).

² In the rediscovery of the pre-Columbian civilizations of the Americas, archaeology is playing an overwhelmingly important part—partly because the Spaniards destroyed most of the destroyable indigenous records, and partly because these records, even before the Spaniards made havoc of them, were rudimentary by comparison with those of the literate civilizations of the Old World. The pre-Columbian civilizations of the Americas reveal themselves mainly through their artefacts; and, for this reason, every Americanist has to be something of an archaeologist, and usually to be an archaeologist first and foremost.

³ Excavations carried out by Chinese archaeologists at Anyang, the capital of the Shang dynasty during the century or two before its overthrow by the Chou, have demon-

all modern-minded people; and already the present-day inhabitants of the countries in which the 'dead' civilizations once rose and fell are beginning to produce archaeologists trained in up-to-date archaeological technique and eager to take a share in bringing to light buried civilizations with which their own society is linked by the geographical bond of having a common home.

It will be seen that the quantity of things to know about human affairs has been increased in the social field—on a scale almost comparable with the increase in the psychic field—by the contributions to mankind's new common pool of knowledge that have been made by the Orientalists, Americanists, anthropologists, and archaeologists. As if this were not enough, there has been a vast simultaneous increase in the facilities for making and preserving documents, owing to the combined effects of several recent Western inventions—particularly the invention (or rather, in this case, re-invention) of the art of shorthand, which has made it possible to dictate letters, memoranda, and books instead of laboriously writing them by hand, and the invention of the typewriter, which has carried with it the device of automatically producing, in one operation, a number of carbon copies in addition to the 'top copy'. The first of these two inventions has led to a sharp increase in the volume of documentation, since, in dictating to a shorthand typist, to be long-winded requires less concentrated mental effort than to be concise, whereas in the old days, when even a grandee had to write his ukases with his own hand, his very sense of self-importance might prompt him not to waste his time by running to prolixity. The automatic multiplication of typewritten documents in carbon copies, some of which are likely to be filed in different registries in different places, now gives a document, once produced, a much greater chance of survival—perhaps even in an age of atomic weapons—than the unique hand-written original exemplar of a document ever had in the past.

Already, before these recent inventions gave the production of documents a sudden new impetus, documents had been piling up in increasing quantities and at an accelerating rate in the Western World. The archives of the Vatican had been supplemented by those of medieval Italian city-states, modern national states, aristocratic houses, private commercial and industrial corporations, and smaller business firms. Some of this material has, of course, already perished—partly through natural accidents, such as damage from fire or from damp, and partly through the wars and revolutions in which Man, the indefatigable builder, gives vent to his counter-impulse towards destructiveness. Up to date, however, a vast quantity has survived. Before the invention of atomic weapons it would have been thought safe to say that Man's capacity for producing documents had definitely won its age-old race with Man's and Nature's combined capacity for destroying them. In inventing atomic weapons we have armed ourselves with the means of disposing of our own vast documentation as the contents of the Library of Alexandria were eventually disposed of, according to the story, in the

strated that the Chinese classical tradition, in which the Shang figure as the Chou's predecessors, is not legend but is authentic history, on this point at least.

furnaces of the local public baths. So far, however, we have had the sense, or the grace, to refrain from getting rid of our gigantic archives by a method that would condemn us to getting rid of ourselves, too, in the process. The mass of documents has increased and is increasing. We do not hold that it ought to be diminished. At the same time we have not yet discovered how to cope with it.

The formidableness of the problem was brought home to me by hearing Sir Keith Hancock talk on the subject at a conference on the documentation of the Second World War that was held in Holland not long after the restoration of peace. Hancock spoke with authority, for he was in charge of the writing of official histories of the war-time acts of the departments of the Government of the United Kingdom. He also spoke with a wit that drove his point home. His point was that the scale of the war-time production of documents was unprecedented. One of the illustrations of this that he gave was that the volume of official documents produced by the United Kingdom Government and its agencies during the six war years 1939-45 equalled, in cubic content, the volume of all previous archives of the United Kingdom and of its constituent kingdoms England and Scotland that had survived down to the date of the outbreak of war in 1939. Another of his illustrations was the calculation that, if all the files produced in one particular ministry during the six war years were to be stacked on edge, jacket pressing against jacket, in a single continuous row, the length of this row would be seventeen miles. His comment on this was that the first thing needed by an historian nowadays was a motor-bicycle to cover the ground.

3. ATTEMPTS TO BRIDGE THE GAP BETWEEN OUR KNOWLEDGE OF PSYCHIC AND SOCIAL PHENOMENA AND OUR KNOWLEDGE OF THE ACTS OF INDIVIDUAL HUMAN BEINGS

This astonishing increase in the number of things to know, and in the quantity of information about them at an inquirer's disposal, has had a disconcerting effect on the relations between so-called 'individual' human beings and the myriad psychic and social actions and interactions in which each individual is involved. It is conceivable that an individual human being's existence consists in his serving as a node, or point of intersection, in two networks of relations between events: an 'inner' psychic network and an 'outer' social one. Events of both these kinds have now come within our cognizance in numbers that are legion; but in the process a great gulf has opened between the individual and both the 'inner' and the 'outer' events in which he is implicated. This consequence of our great increase in knowledge is paradoxical; for the individual is not merely 'implicated' in these events; his existence is bound up with them, and (in Buddhist terms) detachment from them would spell extinction for him. Gossamer threads, charged with coursing energy, must really extend, across both the psychic and the social gulf, between the individual and the innumerable psychic and social phenomena that are now visible to an observer's eye. Can the connecting

threads, in both directions, be brought into visibility too? Unless and until they can, it will be difficult to make much sense of human affairs.¹

On the psychological side this problem of tracing connexions is a new one. In the modern West the fleeting psychic cloud-racks, discerned long ago by the Buddha's inward eye, have only just begun to be charted. Till yesterday this inner psychic universe was beyond our Western science's horizon, and our ignorance of its existence exempted us from the task of trying to analyse its structure. It is to be expected that the psychologists, now that they have revealed the gulf, are going to bring to light the system of psychic relations by which it is bridged. Several hypotheses about the configuration of the human psyche have already been advanced. But these hypotheses conflict with each other, and the science of psychology itself is still too young for there to have been time yet for the debate between opposing schools to have produced even a minimum consensus. At the present moment, speculation as to how this gulf is eventually going to be closed would probably be premature even for psychologists, and would certainly be unprofitable, as well as presumptuous, if attempted by an outsider. It may be more profitable to concentrate our attention, for the present, on the gulf between individual human beings and social phenomena. Our awareness of this gulf is of longer standing; and the problem of tracing the connexions between social phenomena and the actions and interactions of individual human beings is the crux of the study of human affairs on its social side.

There is no difficulty about discerning social phenomena; it would, indeed, be difficult to ignore them, considering that their impact on each of us makes itself felt all the time and, at times, makes or mars an individual's fortunes. Each of us finds himself virtually at the mercy of the social setting in which he has been placed by the accidents of birth and upbringing.² Yet we know very well that these titanic social forces that bear down on each of us, apparently from outside, have no other origin than the acts of individual human beings,³ and no other source of energy than these individuals' respective psychic power-houses.⁴ Granting, as we must grant, that these obstreperous social phenomena are realities of some kind, we are aware, at the same time, that this kind of reality is of a different order from the reality of the puny human beings whose innumerable actions set these huge social forces in motion. We can also see that, by comparison with the reality of a human being, the reality of a social phenomenon is of a secondary order. A social phenomenon is a network of relations between human beings. Remove the

¹ 'Unless the specific structure of the social field is analysed and the mode of the relations between individuals, the actions of individuals . . . are incomprehensible accidents' (C. Trinkaus in *Science and Society*, vol. xii, No. 1 (1948), p. 229).

² 'While the source of action is in Man, the nature of human actions is determined by definite historical social structures within which men act' (Trinkaus in loc. cit., p. 228).

³ Cultures 'do not do anything; only people do things' (P. Bagby: *Culture and History*, p. 116).

⁴ H. D. Oakeley rightly insists that, if there is one principle that shows itself to be absolute, it must lie in the nature of personality (*Philosophy*, vol. xi, No. 42 (April, 1936) p. 189). 'The deepest experiences of personality cannot be transferred to a group of persons as such' (ibid., p. 192). 'A group is essentially a set of interacting persons and their relationships, without the necessity of any tertium quid' (Social Science Research Council's Committee on Historiography's Report (1954), p. 64).

human beings, and the social phenomenon generated by their relations will vanish into thin air. But remove the social phenomenon, and the human beings that have been the authors of its existence will still be there. Being social animals they will not, of course, be able to go on existing in a complete social vacuum; but, if they are forcibly deprived of some particular social institution, or if they themselves forcibly liquidate it in disgust with it, they will live to equip themselves with some new institution to fill the gap. This seems to indicate that the reality of a human being is a reality of a more fundamental kind than the reality of a social institution. Yet social phenomena and their vicissitudes are visible to the intellect's naked eye,¹ whereas nearly all the actions and interactions of individuals, from which these phenomena and their vicissitudes arise, are invisible even under a sociologist's mental microscope.

For instance, in the event of a parliamentary general election we have no difficulty in ascertaining which party received a majority of the electors' votes; but, if we try to study the election in individual terms, instead of being content just to register the institutional result of it, we find ourselves groping in the dark. We know that the casting of the votes was determined by an interplay of thoughts and feelings in each individual elector's psyche, and that this psychic interplay was, to some extent, determined, in its turn, by social relations between each of the electors and other people. But so far it has been quite beyond our intellectual resources to trace, in detail and with precision, how the result of the election, in terms of the casting of votes, is related to the actions and interactions of all the individuals concerned. We know that the resulting social phenomenon is a resolution of these forces that have been exerted by individuals, but we do not know how to conduct an investigation that would bring to light, exactly and completely, how the single conspicuous resultant social phenomenon has been produced by the innumerable obscure generating actions of individual human beings. Similarly, in the event of a battle, we have no difficulty in ascertaining which side won, and we know that the military decision was the result of an interaction of the psycho-physical performances of each of the soldiers actively engaged on the two sides. But we do not know how to trace the relation between the military decision and the way in which each of the combatants conducted himself. This inability of ours to state the results of a battle or an election in terms of the actions and interactions of individuals, which were the real forces whose interplay made the battle or the election turn out as it did, is paradoxical but not exceptional. Whatever kind of social phenomenon we take, we shall find ourselves baffled in

¹ Trinkaus finds (in loc. cit., p. 228) that, in my account of human affairs, 'society disappears as an active structure'. If by 'an active structure' Trinkaus means an agent that takes the initiative, he is stating my view correctly here. On this point I agree with the authorities cited in the preceding footnote. It looks to me as if Trinkaus has fallen into the fallacy of anthropomorphism that is attributed by some other critics to me. I admit to having sometimes written about society and some of its component institutions in anthropomorphic language (see pp. 45-46). With the vocabulary that is at one's disposal, this is sometimes almost impossible to avoid. But my belief is that institutions are not active forces. At the same time, I believe that they are realities—though realities of a different order from human beings. I do not think that there is any contradiction between these two beliefs of mine.

the same way if we try to analyse the phenomenon in terms of the individual human beings who brought it about. 'The number of separate variables which in any particular social phenomenon will determine the result of a given change will, as a rule, be far too large for any human mind to master and manipulate them effectively.'¹

Here is a problem that has confronted all investigators of social human affairs since the moment when investigations were first attempted in this field. Our inability to trace the connexions between the social events that we observe and the actions of individuals by which we know that these events were generated is a gap in our knowledge and understanding that has always been there and has frequently been recognized. This gap has not been created by the recent multiplication of the social phenomena within our ken; it has merely been enlarged. But the enlargement of the gap has brought the problem to a head and is compelling us to face it.

How, in the past, have inquirers into social affairs managed to cope with this crucial hiatus in their intellectual operations? The hiatus is so paralysing that it seems a wonder that they should have succeeded in operating at all. In so far as they have 'got by', they have achieved this by papering over a gap that they found themselves unable to close. They have resorted to two makeshifts. They have made intuition serve in place of investigation, and mythology serve in place of analysis.

Intuition—whatever the nature of this mysterious mental faculty may be—has sometimes served inquirers well in a number of different fields. Intuition enabled the Buddha to anticipate modern Western science's discovery of the psychic universe within an 'individual' human being, and it enabled Democritus to anticipate the discovery of the physical universe's atomic constitution. Yet the results of intuition remain provisional and precarious until they are verified by investigation. As for the use of mythology, it would hardly be possible for a sociologist to write a line of description, or for an historian to write a line of narrative, without resorting to mythological language. Mythology, in the sense in which the term is being employed in this volume,² means a particular use of the mental operation that we call analogy. It means thinking and talking about phenomena that are not human beings as if that was what they were. In giving an account of social phenomena, an historian or a sociologist is constantly slipping into treating them as if they were persons, instead of rigorously treating them all the time as the enormously complex relations between an enormous number of persons which is what institutions really are, but which is also something beyond the human mind's present capacity to apprehend.

This procedure is as misleading as it is difficult to avoid. It is misleading because there is not, I believe, really any illuminating analogy between the psycho-somatic organism that we call a human being and the network of relations between human beings that we call a social phenomenon. If they have any points of likeness at all, they certainly have many more points of difference. Nevertheless, we talk glibly about

¹ F. A. Hayek: *The Counter-Revolution of Science*, p. 42.

² See pp. 250-2.

the actions¹, reactions, feelings, thoughts, intentions, and plans of governments, states, peoples, churches, and other institutions, as if 'legal personalities' were what they purport to be, instead of being the mental fictions that they are.² To ascribe conscious purpose to groups of human beings is mythology.³ We talk and think about institutions in these personalizing mythological terms because that is the nearest intellectual approach that we have been able to make to the elusive realities that lurk beneath these wraiths.

However, in our day we are being compelled to look for more efficient methods of coping with this intellectual problem because of the sudden great widening of our horizon. In the study of human affairs this challenge has had the same stimulating effect as it has had in the study of the physical universe. Physical 'science . . . has been obliged . . . to take account of parts of the Universe, the enormously great and the enormously small, which transcend the range of sizes for which the Newtonian world-picture was constructed'.⁴ In the field of social human studies a corresponding revolution in our vision of the phenomena has led sociologists to go in for minute analysis, and historians to go in for statistical 'prosopography' ('study of persons'). Each of these experiments is an attempt to bridge the great gap between social phenomena and human beings by a pontoon made of intellectually more respectable materials than intuition and mythology. Sociologists are trying to dissect the web of social relations, under a microscope, into smaller and smaller constituent parts, in the hope that these progressive diminutions in the scale of the investigator's observations will eventually bring into view the actions and interactions of individual human beings and, by displaying these in their social context, will reveal, in its concrete continuity, the whole of the hitherto obscure process by which the texture of social phenomena is woven out of raw materials of the personal

¹ See W. Dray: *Laws and Explanation in History*, p. 140.

² These fictitious personifications of non-personal social phenomena are least likely to mislead their users when their fictitiousness is conspicuous. Accordingly, the least objectionable form of this verbal trick is to describe the effects of an institution—say, a state—as acts of a god in whose name the institution is symbolized: 'Amun chastised the barbarians', 'Asshur triumphed over his enemies', and so on. The next least objectionable procedure is to personify the name of the state itself: 'Egypt', 'Assyria', 'Sparta', 'Athens', 'Rome', 'France', 'Britain'. To say 'the Lacedaemonians did it' or 'the Athenians did it' is a more insidious formula, because it implicitly lays claim to a non-existent knowledge of the process by which the resultant effect is related to the thoughts, feelings, and acts of all the individual Lacedaemonians and Athenians. Still more specious are such constitutional formulae as 'King Philip and the Macedonians' or 'the Roman Senate and People'. They purport to analyse the actors into their constituents, whereas in fact they leave the gap between social effects and individual originators of these effects still wide open. The most unsatisfactory usage of all is to ascribe political events to the personal action of an individual human being: 'Pharaoh', 'Caesar', 'the Queen'. This language might really mislead users of it into imagining that political events are the personal acts of the human being to whom they are ascribed; and that, of course, would give a wholly misleading idea of how political institutions work. The social operations that constitute the government of even the smallest and most simply organized state immensely exceed an individual human being's maximum capacity for action, however domineering, decisive, energetic, industrious, intelligent, physically strong, and long-lived the person in question may be. Of all the acts that are attributed to a ruler, only a small fraction can ever be genuinely his own; the majority of the acts done in his name will, in truth, have been the acts of other people. This is as true of a ruler who is theoretically an absolute autocrat as it is of one whose powers are constitutionally limited.

³ M. R. Cohen: *The Meaning of History*, p. 125.

⁴ J. Needham: *Science and Civilization in China*, vol. ii, p. 339, following Niels Bohr.

order of reality. From the opposite bank of the river of ignorance historians are trying to span the gap in the reverse direction. Starting, not from social phenomena, but from human beings, they are trying to trace how the ascertainable actions and interactions of individuals build up into social phenomena, and thus to find a way of describing, discussing, and explaining these phenomena in terms of human realities, in place of the language of social mythology, with which historians have hitherto found themselves unable to dispense.

On the sociological side one distinguished living authority, Michael Postan, goes almost to the length of identifying the microscopic method of sociological inquiry with sociology itself.

'What makes a question sociological is not only the nature of the problem it raises, but also the nature of the answer it requires. It is the great virtue of some questions that they can only be answered in a sociological way, by the laborious and painful process of social analysis, by defining and classifying social groups and institutions, by counting and measuring the differences in social arrangements from place to place and from time to time. . . .

'Sociological treatment . . . involves a difference in scale. . . . The scale of the social scientist is . . . infinitesimally small compared with that of Professor Toynbee's book. . . . He does not intend to solve the problems of civilization and society by a frontal attack on the massed evidence of all the historical societies. All he hopes to do is so to organise the study of his minute topic as to be able to answer, by the light of its evidence, at least some of the problems which are common to society in general. In this, he differs not only from the antiquarian, who is interested in his patch but has no questions to ask, but also from the philosophical historian like Professor Toynbee, who has all the questions in the world to ask but no patch on which even a single satisfactory answer can be raised.'¹

Will the sociologists succeed in carrying their pontoon from its taking-off point in the field of social phenomena to the farther shore, which they will have reached if and when they succeed in describing and explaining social phenomena in terms of the acts of individual persons? Their intellectual engineering technique of building each successive section of their pontoon of a shorter length than the preceding section might seem, to a lay spectator, to be unpromising. The problem with which they are contending is that of dealing with 'the enormously great', and they are seeking to solve this problem by a technique of *diminuendo*. This looks rather like courting the fate met by Achilles in the famous logical puzzle of his race with the tortoise. The logical conditions laid down for registering the runner's progress deny to him, *a priori*, the possibility of ever reaching his goal. The exclusive use of the microscope, on the unconvincing assumption that this, or any other, instrument is an omniscient tool, is, I should say, the fundamental and permanent weakness of sociology, if this assumption is really of the essence of its operational creed, as Postan seems to hold that it is. This is also a particularly serious weakness in an approach to

¹ M. Postan in *The Sociological Review*, vol. xxviii (1936), pp. 62-63.

the study of human affairs at a time when the problem of quantity is the major problem in this field. This point has been neatly put by Bagby.

'It would be a great thing if someone could invent a "macroscope", an instrument which would ensure that the historian would see only the larger aspects of history and would blind him to the individual details. It is only by remaining at this higher level of abstraction that we can hope to decipher the principal patterns of historical change, to identify the "forces", whatever they are, that have made the World what it is today. . . . It is the very broadest regularities for which we should first search, since these are likely to be necessary for the explanation of any smaller phenomena.'¹

These precepts apply, of course, not only to historians but to all students of human affairs, including sociologists.

Contemporary sociologists and social anthropologists have also been criticized by Bagby on several other grounds. One of these is that their

'studies have been primarily static in nature, more concerned with social structure in the present than with its development in time. Yet [as Bagby justly comments] it is precisely the developments, the changes in the lives of many human beings over the course of centuries, which are of major interest to the student of history.'²

They are, indeed, of major interest to all students of human affairs, under whatever label they happen to do their work, since human affairs are never visible except as being on the move, whatever may be the angle from which one is looking at them.

Bagby goes on to point out³ that the studies undertaken by contemporary sociologists 'are dependent on direct observation and tend to neglect some of the important aspects of group life', and that, 'in addition, while their science theoretically deals with the structure and functioning of all societies, in practice their studies have very largely been confined to European societies or those of European origin', and that 'their concepts and methods are therefore not, on the whole, designed for universal application'. All these observations of Bagby's may be valid as criticisms of current sociological practice. But there is not anything, inherent in sociology itself, to prevent sociologists from remedying the present defects in their work that Bagby criticizes. It is open to them to enlarge the scope of their operations. Bagby himself mentions⁴ that 'Max Weber . . . saw the necessity of comparing the social structure of our own with those of the other civilizations if we are to be able to make generalizations valid for all mankind', and that, although Weber's 'initial studies have never been followed up by the sociologists, . . . the social anthropologists . . . have begun to examine Chinese and Indian social structure in the last decade or two', and, 'in addition, . . . have made many synchronic [i.e. static] studies of this kind among individual primitive peoples'. It looks, in fact, as if sociology needed only the necessary time to extend its geographical horizon

¹ P. Bagby: *Culture and History*, pp. 128 and 158.

² *Ibid.*, pp. 9-10. Cp. p. 185.

³ *Ibid.*, p. 8.

⁴ *Ibid.*, p. 185.

from the West to the World as a whole. There also seems to be no reason why it should not replace the rather abstract method of studying social phenomena in cross-section by the more realistic one of studying them in time-depth. The crucial question for sociology would seem to be whether it is or is not indissolubly wedded to the use of the mental microscope as its exclusive instrument. It is to be hoped that it is not, since the study of human affairs cannot afford to see any of the present approaches to it stultified.

On the historical side the problem of bridging the gap between human beings and social phenomena in our intellectual comprehension of human affairs has been attacked in the present generation by a method which seems promising in itself and which has, in fact, been vindicated already by some brilliant successes. This 'prosopographical' method tries to bring social mythology down to earth by taking, for its initial units in a study of some social phenomenon, as large a number of the relevant acts of as large a number of participating individuals as the state of the extant information allows.¹ In this approach the ideal would be, presumably, to make an exhaustive survey of all relevant acts of all individuals concerned, and then to give an account of the social phenomenon in view in terms of generalizations from these data. But, apart from the philosophers' doubts about the logical validity of induction by complete enumeration,² it is, in practice, impossible, in any investigation into human affairs, to survey these exhaustively. Even where one is dealing with a small and more or less closed circle of *dramatis personae*, and where also the accessible information about each of them is comparatively copious, what remains undiscovered will still far exceed what has been brought to light, even if we have conducted our researches with the utmost possible skill and industry. Accordingly, when the prosopographical historian has built the first section of his pontoon to the maximum length allowed him by his supply of *personalia*, he has to prolong it by a different form of structure. If he is to give himself any chance of reaching the other side of the gap between the personal acts of individuals and social phenomena, he must extend the reach of his information about personalities by generalizing from this with the aid of such devices as sampling and statistics.

In this procedure the prosopographical historian's technique is the inverse of the sociologist's. It is one, not of *diminuendo*, but of *crescendo*.

¹ *Ad hominem*, I myself have been gently criticized in *The Japan Chronicle*, 29th July, 1934, for not having made enough use of this approach. 'If fault is to be found with Mr Toynbee's work, it is that he does not seem to give sufficient value to the individual element. . . . The individual merits the attention of the historian as well as the society of which he is an eminent unit.' I myself would go so far as to say that, even when he is not eminent (and the great majority of us are not), he still merits the historian's attention if the historian can lay hands on evidence about him and his acts and their effects. It seems likely that, in this book, I may have paid too little attention to individuals, since my first (though not my exclusive) concern here has been to try to trace regularities and uniformities in social phenomena. If I have been guilty of this neglect in practice, I have been failing to live up to my own principles. In principle, I hold that human beings are the source of all social phenomena, and are therefore realities of a higher order than these are. I believe that my contemporaries who have taken the prosopographical approach to history have chosen a promising (though not the only promising) line of work. And I much admire their achievements.

² See pp. 23-24.

The method would appear to be a more promising one, in itself, for grappling with the problem of quantity by which the historian and the sociologist are both confronted. It is also more promising because of the fortunate coincidence that, at the very time when historians have been taking to a method that has led to their seeking help from the procedures of sampling and statistics, these procedures have been gaining in potency through the acquisition of new experience and new equipment. In the present generation the art of sampling has been applied to human affairs in many fields—for instance, in the study of the preferences of consumers of goods and casters of votes with a view to trying to predict what their future choices are going to be. Contemporaneously, the science of statistics has been developing its mathematical apparatus and has been supplying itself with ministering *jinn*s in the shape of electronic computers. These electronic 'brains' cannot, it is true, serve as substitutes for human minds. They cannot take the initiative in propounding questions or in formulating problems. But when once a problem has been formulated by a human mind in the terms of binary arithmetic—giving the machine the simple choice of answering 'yes' or 'no'—the *jinn* can perform the calculations demanded of him by his human master on a colossal scale in almost no time. Thanks to the sudden rise of the new science of cybernetics, it now looks as if human ingenuity, with the leviathan-power of an electronic Briareus at its command, may eventually succeed in bridging the gap between social phenomena and the acts of individual human beings by starting from the prosopographical historian's point of departure and using the contrivances of sampling, statistics, and electronically-operated computers to carry the human mind across the gap between the two banks.

For making the prosopographical approach to the problem of bridging the gap between human beings and institutions, the most favourable situations are obviously those in which a relatively small minority of the participants in a society, constituting a more or less strictly closed social circle, control between them one or more of their society's more important institutions, or even the society's whole life. The smaller the number of both the human beings and the institutions that are involved, the simpler the prosopographical researcher's task will be, and this for several reasons. The number of the units, of both the personal and the institutional order of reality, with which the researcher will have to deal, is then likely to be manageable; and the persons concerned, being all of them privileged and some of them eminent, are likely to be fairly well documented. Prosopography lends itself, in fact, particularly well to the study of the management of social affairs by oligarchies—military, political, economic, or ecclesiastical. It has been applied, for instance, with notable success, to studies of the eighteenth-century political oligarchy in the United Kingdom and of the Roman aristocracy during the last two centuries of the republican regime, especially the final decades that are documented by Cicero's letters and speeches and by an increasing flow of Latin inscriptions. In these two fields brilliant pioneer work has been done in England by two scholars, born elsewhere, Sir Lewis Namier and Professor Sir Ronald Syme, who

have paid England the compliment of settling there and doing their life-work in an English intellectual environment. Two other oligarchies that have been studied in a comparable way are Alexander the Great's officers and the Prophet Muhammad's companions. The Venetian oligarchy and the Roman Curia would, no doubt, lend themselves to the same method of historical research. The richest mine of all is probably the series of Chinese dynastic histories, since these are on the grand scale and are organized partly on 'prosopographical' lines. A considerable section of each of them is allocated to biographical notices of distinguished persons, and these not only in the political line. A beginning has already been made with the use of these Chinese materials for a prosopographical approach to the study of Chinese social phenomena. The development of the relations between the Topa barbarian invaders of North China and the Confucian gentry within their domain has been studied in this way by W. Eberhard,¹ and the materials for a similar study of the corresponding relations of the Confucian gentry with the Manchu invaders have been sorted out and published by A. W. Hummel.²

Perhaps most human institutions, communities, and societies, at most times and places, have been managed by minorities of the total number of human beings concerned, even when and where the institutions have been officially democratic. Oligarchy has been common because the two antithetical human tendencies to take a lead and to follow one seem to be unevenly distributed as between different individuals, even though there may be something of either tendency in everyone.³ This question of leadership is discussed further at other points in this volume.⁴ Without needing to adopt any particular conclusion about it, we can see that, while a considerable sector of the total field of social affairs has been oligarchically managed in the past, there is also a large sector in which oligarchical management is at any rate less conspicuous. Moreover, this more democratic sector seems likely to increase relatively in the future, as hereditary privilege is progressively whittled away by the graduated taxation of wealth and by the free education of ability. Furthermore, even in the most oligarchically, or indeed monarchically, managed society, in which the material and spiritual amenities of culture are withheld from the majority of the participants in the society in question, every one of these obscure individuals will, nevertheless, make his or her influence felt, in some infinitesimal degree, in the shaping of social events by human action. Accordingly, if oligarchy were a necessary condition for making an episode of human affairs a suitable subject for prosopographical treatment, this method would not be an effective one for dealing with human affairs in general. Fortunately it is at this point that the new mathematical and electronic aids to the art of sampling and to the science of statistics will come to the prosopographer's rescue. They will enable him to cope with units in far greater

⁴ On pp. 125-7, 148-50, and 305-6.

numbers than could ever be handled by single human minds that did not have this Briarean apparatus at their command. Present scientific and technological progress in this sphere makes it not unreasonable to expect that the prosopographical study of human affairs, after its brilliant start in a field in which the numbers are small enough to be manageable without the use of apparatus, will prove able, with the help of apparatus, to extend its operations into fields in which, without this help, the numbers would be unmanageably great.¹

It looks, then, as if there were fairly good prospects of bridging the gap between human beings and social phenomena from the prosopographical side, if not from the sociological side. In any case, whether the prospects are good or bad, we cannot afford to abandon our attempts to solve this problem, for that would mean abandoning the study of human affairs, and we certainly cannot afford to do that. To conduct this study successfully, we have to pursue three studies in conjunction: the study of human beings, the study of social affairs, and the study of the relations between these two different orders of reality. So we must resist any suggestion for abandoning any one of the three, whether the motive inspiring the suggestion is defeatism or is prejudice. We must resist the historians' prejudice against the analysis of social phenomena and the investigation of regularities and uniformities in these. Equally we must resist the social philosophers' prejudice against the narration of particular events and particular acts of particular individuals. Both lines of inquiry are indispensable; the two can, and in fact do, co-exist; and, unless they are simultaneously pursued, it will be impossible to make the study of human affairs intelligible; for these will not become intelligible till human beings and social phenomena have been brought into an intelligible relation with each other by either the prosopographical approach or the sociological approach or both.

4. THE DISTORTING EFFECTS OF DEVICES FOR REDUCING THE QUANTITY OF INFORMATION

Hellenic thinkers despised particulars in principle as being intellectually contemptible, and esteemed generalities as being intellectually admirable. In their practice they were more catholic than in their theory;² for they produced a galaxy of great historians, including eminent exponents of the prosopographical method, such as Plutarch, who presented the whole panorama of Graeco-Roman history in his series of parallel lives, and the 'doxographers', who recorded the doctrines of the Hellenic philosophers in their personal contexts. The Hellenic theory

¹ *Ad hominem*, I have been criticized (in the most friendly terms) by Lord Samuel, in *John o' London's Weekly*, 5th January, 1935, for having 'touched little upon the standards of life and thought of the average man' in vols. i-iii, and again by a reviewer in *The Economist*, 6th November, 1954, on the score that 'the common people do not receive the place or proportion' in my 'scheme of things which must surely be theirs on any transcendental view of history'. I admit the charge and plead, in my defence, that this grave omission on my part has been due to a lack of means, not to a lack of will. 'Give us the tools, and we will do the job.' Besides the modest motor-bicycle for which Sir Keith Hancock indents, every historian nowadays needs an electronic computer.

² This Hellenic attitude has been touched on already on p. 18.

on this issue was introduced into the modern Western World at the Italian Renaissance and was not jettisoned when Hellenism in general suffered its defeat in the seventeenth-century 'Battle of Ancients and Moderns'. The Hellenic prejudice against taking account of particulars and individuals in the study of human affairs was maintained by the Western philosophers of the eighteenth-century French school; and it was not killed by the reaction against it in the nineteenth-century Romantic Movement. It has still found active and able representatives in the present generation. Philip Bagby, for instance, suggests, in his prolegomena to the comparative study of civilizations,¹ that

'it is perfectly possible to admit that occasionally individuals do affect culture and still to maintain that the elucidation of cultural processes and the broader features of experience which affect them is the most promising method of making historical events intelligible. From this point of view, the part played by individuals will be seen as a random or inexplicable element.'

Bagby argues² that, though individuals may affect *what* other people do, they do not affect *the way in which* they do it. He also emphasizes the social, as opposed to the individual, contributions to inventions. It is well known that the last step in making an invention is often taken almost simultaneously, and apparently independently, by several individuals,³ and the reason is that all of them alike are really drawing much more on a collective and cumulative advance in knowledge and understanding than on their own individual genius. Cultural growth releases individual genius that is always potentially present.⁴ 'The man of genius . . . is, in an even more intimate sense than the ordinary man, the product of a society and a culture.'⁵ 'The dichotomy between great men and social forces is a false one. . . . Great men are precisely the points of intersection of great social forces.'⁶ 'The appearance of a succession of great philosophers, musicians, or artists in a given country and century appears to be an amazing coincidence unless we recognise the social character of these achievements, the social fund of knowledge, techniques, and aspirations which reach their summits in the careers of a few outstanding individuals.'⁷ 'Granted that gifts are individually congenital, it is the cultural setting into which they are born which makes or prevents their realisation.'⁸ 'What we are wont to call "great men" are those among many more individuals of above-average ability who happen to get born in a time and place and society the patterns of whose culture have formed with sufficient potential value and have developed into sufficient

¹ P. Bagby: *Culture and History*, p. 156.

⁷ Cohen, op. cit., p. 222.

⁸ Kroeber: *Style and Civilizations*, p. 61.

ripeness to allow the full capacities of these individuals to be realised and expressed.¹

Kroeber points out² that there is 'a correlation between realised genius and opportunity given by stage of a civilization's development'.³ If an individual genius does make a discovery for which society is not ready, this discovery will be ignored, as Mendel's was, till society has caught up with the genius intellectually.⁴ 'Watt's invention of the steam engine fitted into the practical needs of British industry in the eighteenth century far more than Hero's invention into the economy of Hellenistic or Saracen culture.'⁵

A. R. Burn suggests⁶ that the reason why the prophets of the 'Axis Age' made their appearance and won their followings more or less contemporaneously was that, by that time, large populations had been detribalized as a result of the development of towns in the Bronze Age, while traditional beliefs had been discredited by the subsequent decline and fall of the bronze-age civilizations. 'It was not the personalities of these great men that were unique, but the opportunity. If they had lived earlier, they could have been poets, but not the prophets that they were. The effectiveness in society of even the most original individual thought is a social achievement. The thought of a prophet cannot be preserved without disciples; and every gospel requires a *praeparatio evangelica*.' Burn goes on to suggest⁷ that 'the only two recorded higher religions to emerge in "primary" civilizations . . . were "abortive" . . . because the traditional polytheisms were not yet sufficiently discredited'. These two higher religions had been deliberately invented by two kings, the Pharaoh Ikhnaton and the Inca Viracocha, as responses to the challenge of their individual situations. At the beginning of the process of detribalization, 'among the first men to feel acutely the stresses, the loneliness, and the need for heroism in their position as individuals were kings and chiefs'. In these two cases the lonely individual's isolatedness defeated his attempt to cure his loneliness by communicating a consciousness of the same distress to his fellow human beings and persuading them to adopt a common remedy of his devising. 'Any fool can devise a more consistent system than exists, but even a despot rarely can institute one.'⁸

In general Bagby argues that the influence of so-called 'great men' on public affairs has been much exaggerated—e.g. the role of revolutionary leaders and military commanders.⁹ The Social Science Research Council's Committee on Historiography goes with him to the extent of reporting¹⁰ that 'to-day it is generally agreed that leadership is a relation to which the leaders, the followers, and the requirements of the

¹⁰ The Social Science Research Council's Committee on Historiography's Report (1954), pp. 64-65.

situation, including the traditions of the group, all contribute'. This is of course, true.¹ We seize upon the actions of 'great men' as explanations of social events because some of their acts are on record and are ascertainable, whereas most people's acts have passed into oblivion. To reduce the role ascribed to individuals to its true proportions is a valuable intellectual exercise. The distinction between an individual and his social and cultural environment is, in truth, an arbitrary and artificial one,² though the drawing of it is also the essential first step towards beginning to think about human affairs at all.³

In Bagby's mind an eighteenth-century depreciation of the role of individual human beings in social and cultural human affairs is reinforced by a twentieth-century pessimism about the practicability of coping with the problem of quantity if once the study of individual persons and particular events has been admitted to be necessary.

'It is . . . impossible as a practical matter to trace all the influences which have led to the formation of the character of an individual in the past. The evidence is simply not available. And, similarly, . . . the task of tracing individual interactions anywhere but in the very recent past far exceeds our powers.⁴ . . . We simply do not have sufficient evidence to establish the sequence of events at this level and, even if we had, we should not have the time to study it in all the necessary detail. . . . This is probably the major reason why history has proved unintelligible up to date. Our inveterate and natural habit of conceiving [of] human events at an individual level has led us to persist in a hopeless undertaking.'⁵

The undertaking is not truly a hopeless one if there is any force in the considerations that have been set out in the present chapter; and, if we were to be so faint-hearted as to abandon the undertaking, we should be landing ourselves in a truly hopeless situation. Bagby's solution for the problem of quantity in the study of human affairs is to exclude individual human beings from his purview.

¹ This point is made wittily in an anecdote recounted by Herodotus in Book VII, chap. 125. 'Timodemus of Aphidna was nagging Themistocles about his embassy to Lacedaemon, and was saying that it was for Athens' sake, not for his own, that the Lacedaemonians had paid him such honours. Timodemus kept on nagging like this, till at last Themistocles said to him: "Look! Certainly I would not have been treated with such distinction by the Spartans if I had been somebody from Belbina; but you, Sir, would not, in spite of your being an Athenian."'

The same anecdote is recorded by Plutarch in his *Life of Themistocles*, chap. 18, in a different version: 'A man from Seriphos once said to him that he owed his fame not to himself but to his country. "You are right", replied Themistocles. "I should not have become famous if I had been a Seriphian, but you would not if you had been an Athenian."'

² This is equally true of the distinction between an individual—or a group of human beings—and mankind's physical environment (see pp. 146-8 and 314-27).

³ If Bagby had confined himself to these empirical considerations, he would have been on strong ground. But he cuts this ground from under his feet by deliberately subordinating Reality to the exigencies of the pattern in his own mind. The explanation of culture by the actions of individuals is excluded, Bagby says, not by the fact that it is 'not sufficiently well-formulated, but by the nature of our theory, by the way in which we conceptualise the data. . . . We are engaged in theory-construction. . . . Individual actions are excluded *a priori*'.

I have some sympathy with Bagby in his commission of this intellectual sin. I have committed it myself, and have been censured for doing so by my critics—Bagby among them. It is a sin nevertheless. If Bagby had lived, perhaps he would have repented of it.

⁴ P. Bagby: *Culture and History*, p. 54.

⁵ *Ibid.*, p. 150.

'What we are talking about are regularities in the behaviour of groups of human beings, ways of doing things. . . . Individuals and their actions are abstractions on a different level from that on which we propose to conduct our investigations.'¹

Individual human beings and social human phenomena are certainly alike in being abstractions from Reality, and different in being abstractions from it on different levels. The making of abstractions is, as we have seen, of the essence of the activity of thinking. But this operational necessity brings with it distortions in our mental picture of Reality which we must be striving perpetually to correct, and we can correct them only in so far as we can achieve the intellectual *tour de force* of recombining what we have distortingly put asunder. We are depriving ourselves, in advance, of the possibility of performing this needful but particularly difficult intellectual operation if we rule out any one of our abstracted facets of Reality from further consideration. Historians are making this mistake if they propose to rule out the study of regularities and uniformities in social phenomena. Bagby is making the same mistake in reverse in his proposal to rule out individuals and their actions. Any inquirer, following any line of approach, is free—or it might be nearer the truth to say 'bound'—to make any abstraction that seems to him promising for operational purposes; but, if the investigation that he is trying to conduct is to be fruitful, he must eventually reassemble the fragments into which, for temporary working purposes, he has mentally dissected the really seamless web of human affairs.

Proposals to leave human beings out of account or to leave social patterns out of account in the study of human affairs are not the only variants of the idea of trying to cope with the problem of quantity by a recourse to intellectual surgery. There is also an old habit of cutting the study up into separate 'disciplines', and there have been a number of suggestions for cutting it down by cutting out of it all but some single one of Man's major activities, or all but one single track in mankind's multiple movement through space-time. All such attempts at a solution by simplification are defeatist in their spirit and distorting in their effects.

Ad hominem, I have noticed, in surveying criticisms of my own work, that a number of critics have used up a number of lines of print in discussing, in all earnestness, whether I am justified, as an historian, in dealing with theological, philosophical, and sociological issues, and conversely whether, if I do behave like a theologian or perhaps like a poet, I am entitled to call myself an historian.² These solemn discussions seem to me to make no sense apropos of intellectual work. They imply, I think, the tacit drawing of an analogy between intellectual work and public administration. As I see it, this analogy does not hold; and scholars who fancy that something is gained by drawing it are, I should say, convicting themselves of being intellectual mandarins. I speak from some experience of both worlds, since, in the course of the First and Second World Wars, I have spent nearly ten years of my working life, all told, as a temporary civil servant.

¹ Ibid., p. 150.

² Examples of such criticisms have been cited on pp. 37-41.

In this, to me, alien world I have had an experience that has been common to many outsiders who have had an inside glimpse of it. I have been partly amused and partly exasperated by the civil service's occupational disease of 'departmentalism'. 'This business is—or is not—our—or your—department's affair'; 'this file is—or is not—for my—or for your—attention'. Though officially just a department of one almighty sovereign state, each department is *de facto* an independent 'great power', and this not only in Japan, but also in the United States and the United Kingdom. Even over trivialities, and this even in war-time, departments conduct diplomatic negotiations with each other with portentous gravity and at extravagant length. Perhaps this departmentalism may have something to be said for it in public administration on an elephantine scale. On this scale orderliness is genuinely so important that it is not altogether paradoxical to argue that form matters more than substance and that the approved procedure must be followed even when this thwarts the achievement of desirable results. Short of admitting this, it is perhaps plausible to suggest, in the light of a formidably large dossier of experience, that this state of mind, which seems characteristically and reprehensibly 'bureaucratic' to outsiders, is in any case inevitable in a world of professional administrators on a large scale. My quarrel is not with the civil servants; it is with scholars who gratuitously import the bureaucratic state of mind into the field of intellectual inquiry.

In this field the bureaucratic approach is not only incongruous; it is obstructive; for, in intellectual inquiry, freedom is the breath of life and formalism is, not a safeguard, but a shackle. There is nothing to be said for breaking up the study of human affairs into the so-called 'disciplines'. These have grown up haphazard, independently of each other. In consequence there are overlaps between them and also gaps that are covered by none of them. The relations between them have never been reviewed or revised on a rational plan.¹ Indeed, any suggestion that this should be done would be likely to arouse hot opposition. The feeling between the votaries of the different intellectual disciplines is almost as bad as it is between the adherents of the different higher religions. There are historians, for instance, who do not admit that sociology is a legitimate form of study, or who, if they do admit this, do so only on the proviso that the two disciplines are to be deemed to have nothing to do with each other—a fantastic notion, considering that history and sociology are concerned with the study of the same affairs.² There are

¹ The best suggestion that I know is A. L. Kroeber's. He suggests that anthropology is the study of cultures, sociology that of societies, psychology that of individuals, history that of events (*The Nature of Culture*, p. 104). This is logical. Yet in practice it would be difficult to work in any of these four disciplines without trespassing on the fields of the other three as here defined.

² A common-sense verdict on this benighted feud has been pronounced by A. L. Kroeber. History, as Kroeber defines it, deals in phenomena, science in process. An interest in phenomena and an interest in process are both necessary. Which of the two a particular inquirer should concentrate on is a matter of temperament (A. L. Kroeber: *The Nature of Culture*, pp. 63 and 62). 'It is as one-sided, and ultimately sterile, to be exclusively occupied with structure as with function' (*ibid.*, p. 88). M. R. Cohen shows the same wisdom in observing that 'history is one [italics mine] of the ways of organizing human knowledge' (*The Meaning of Human History*, p. 41).

philosophers, again, who take up a corresponding attitude towards psychology.

Such attitudes are not only absurd but obscurantist if it is true that dialectical debate is the source of advances in knowledge and understanding,¹ and that, the wider the field of discussion, the greater the chance of striking out fruitful new ideas. When each discipline draws in its horns and tries to turn itself into a Leibnizian 'monad', intellectual progress is being sabotaged; for there can be no exchange of ideas between the inmates of windowless houses; and the cutting of inter-disciplinary communications is the more damaging because the traditional boundary walls between the disciplines are unplanned and arbitrary. 'If we throw aside . . . administrative considerations and look at the problem itself, we see that the difference between the philosopher and the historian can only be one of degree and emphasis.'² These conventional barriers are particularly cramping at a time, such as that through which we are now living, in which knowledge and understanding are in flux, and in which successive increases in both of them are making repeated revolutionary changes in the configuration of the whole of our intellectual landscape.

What is needed now is a ruthless demolition squad, armed with the intellectual equivalent of atomic artillery, to batter the traditional inter-disciplinary dividing walls down to the ground. This would restore the natural unity of the field that has been cut up, for so long, by these encroaching enclosures. No doubt, at all times and in all intellectual situations, the huge field of human studies needs to be parcelled out for operational purposes. But the partitions should be provisional only, and they should be demarcated by transferable hurdles, not by embedded stone walls. Or, if we think of the study of human affairs as being a house of many mansions, we should construct it, not like a Western house, but like a Japanese house, in which the internal arrangements can be given any number of alternative configurations, interchangeable at a moment's notice, because the interior is divided up by movable screens, not by walls that are 'permanent fixtures'.

Meanwhile, among some followers of each of the existing disciplines, there seems to be an increasing assertion of each discipline's claim to separateness and independence, and an increasing desire to keep their own discipline's monadic blank walls erect along their traditional alignments.³ This rising temper is significantly like that of some of the

¹ See pp. 41-45 and 641-2.

² M. R. Cohen: *The Meaning of Human History*, p. 7.

³ This monadic-mindedness has entered into some of the criticisms of my work (see p. 38, footnote 1). Critics representing this school have taken the trouble to report that I am, or am not, this or that—apparently in the belief that the word written on the label of a jar has some power to affect the quality of the contents.

L. Stone would like to disallow my claim to be an historian because so much of the contents of vols. vii-x of this book is the kind of thing that requires a metaphysician, not an historian, to review it (*Toynbee and History*, p. 111). 'The questions Dr Toynbee asks are largely irrelevant to their [his "professional" colleagues'] concept of the proper study of history, which consists in studying the past for its own sake, in attempting to understand and differentiate, to arrange and classify, the discoverable facts about the nature of a given society in a given period. They are convinced that the differences between civilizations are more significant than the likenesses, and that standardised causal patterns cannot logically be deduced from the facts of history' (Stone, *ibid.*). 'If it is

nationals of each of the contemporary local states. On the plane of politics, states are counterparts of disciplines on the plane of intellectual inquiry. So perhaps this common temper gives the key to the anxiety that is being shown to preserve the traditional intellectual partitions from being demolished. This anxiety is manifestly perverse in an age in which these traditional partitions have become obvious impediments to the advancement of knowledge and understanding; and at first sight such perversity seems strange. It may be accounted for in the diehard champions of the departmental disciplines, as it certainly is accounted for in those of the parochial states, by a dread of the unknown situation that awaits them, out in the open, in boundless space, if the familiar walls of the present voluntary prison houses are torn down. This anxiety may be natural, but it is neither rational nor expedient. It offers no basis for a constructive policy. It needs to be combated and overcome. 'Specialisation has . . . prepared the way for a new universalisation, but there is not yet any recognition of this truth, and hardly any use is yet being made of this opportunity.'¹ The objective has been defined by

true that Mr Toynbee has tried to generalise Gibbon's inquiry, he has failed to notice that, in doing so, he has ceased to be an historian, except incidentally. . . . His comparative study of the rises and falls of civilizations should be taken as a contribution, not to history, but to "Social Dynamics". . . . His true predecessor here is not Gibbon but Auguste Comte' (W. H. Walsh in *Toynbee and History*, p. 126). 'When Mr Toynbee discusses questions about the meaning and point of the historical process as a whole, he writes, not as an historian or even a sociologist, but as a metaphysical philosopher. If in his early volumes he is in effect a successor of Comte, his models here [i.e. in vols. vii-x] are such writers as Vico, Herder, and Hegel' (Walsh, *ibid.*, p. 127). In proposing to present history as, in the end, a theodicy, 'it is surely clear that . . . he has travelled far . . . from what any normal historian would regard as history proper' (Walsh, *ibid.*, pp. 126-7). 'It is not objective, or even interpretative, history. It is theology' (H. E. Barnes: *An Introduction to the History of Sociology*, p. 729). E. Berkovitz, too, finds that my work is not history but a philosophical and theological interpretation of history (*Judaism: Fossil or Ferment?*, p. 9). G. J. Renier's pronouncement on my work is that 'it is the supreme embodiment of what I [i.e. Renier, not Toynbee] call "left-wing deviationism", the confusion between history and the philosophy of history' (*Toynbee and History*, p. 73). W. Kaufmann feels that my 'determination to mix genres' makes it enormously difficult to do me justice (*ibid.*, p. 306).

Critics of this school are, it seems to me, paying too much attention to labels, which, in my belief, are not either interesting or important. This preoccupation of theirs offers their human target an easy way of putting them out of action. He has merely to read the label on the critic's hat and affix a different label on his own. He will then be able, with impunity, to talk as much nonsense as he likes, as far as this particular critic is concerned. However outrageously he behaves, he can count on the critic's simply registering 'not my subject'.

Fortunately, there are other critics who rate labels at their true zero value and see human affairs as the unity that they really are. W. H. McNeill, for instance, after noting that 'Toynbee has felt himself free to connect his studies of history with ultimate philosophical and theological questions', suggests that this is a challenge to other present-day historians (*The Intent of Toynbee's History: A Cooperative Appraisal*) H. Kohn dismisses the criticisms of the present book that censure it for not being history. He submits that I am not trying to write history here, though I have done that in other books of mine, e.g. *The Survey of International Affairs* (*Der Monat*, August, 1955, p. 464). K. W. Thompson suggests that I must be judged both as an historian and as a philosopher of history (*Toynbee and History*, p. 201). E. Fieser finds that the present book 'is not a work of history' and, 'a fortiori, not a work of archaeology, sociology, philosophy, theology, or even of all these combined; it enters into each one of these fields, but no man can be an authority in all of them. Taken as a whole, it is a huge theological poem in prose' (*ibid.*, p. 383). This last sentence of Fieser's has already been quoted on p. 39, footnote 1.

I like being called a poet. I do not suppose that any real poet would acknowledge me as being his confrère. Nevertheless, I will make no objection to having this label affixed to me by non-poets, if this will induce my critics to give up the unprofitable game of debating which, if any, of the 'disciplines' is my legal domicile.

¹ E. R. Curtius in *Mercur*, 1. Jahrgang, Viertes Heft [Heft 4] (1947), p. 493.

A. L. Kroeber in language that is less militant and more statesmanlike than mine. Kroeber believes 'the time to be near when efforts for closer federation in the united sciences may well come from students of culture'. 'This great unity', he declares, 'is the true study for the student of Man.'¹

If partition is a wrong way of trying to deal with the problem of quantity in the field of human studies, so is omission; and this applies equally to both the main devices for lightening the human mind's fast-increasing cargo. One of these is to pick out one of Man's plural activities—say, politics or economics or technology or religion—and to give this the status of a 'master-activity', with the implication that the other activities may and should be ignored except in so far as they can be treated as being subordinate to the single activity that has been given pride of place. This device would certainly simplify the problem of quantity by drastically reducing the number of phenomena to be taken into account.² It involves us, however, in insuperable difficulties as soon as we try to carry it out. These difficulties are discussed in the annex to the present chapter,³ so we need not go into details here. The other device is as old as human nature itself, or indeed as life, since it is a patent reflection of the self-centredness that is inborn in every living organism. It is based on the assumption that the inquirer's own religion, civilization, community, or parish in the inquirer's own generation is the culmination of all human history, without even adding the proviso 'up to date'.⁴ On this scheme the inquirer gives himself licence to ignore everything in human affairs that does not lead up to his own 'here and now'. This egocentric device would, of course, reduce the number of the phenomena as effectively as the 'master-activity' device would; but, like that device, this one, too, is impracticable. Now that all the histories of all the societies, in all ages and in all parts of the World, have been pooled in one all-inclusive intellectual heritage, accessible to the whole human race,⁵ it is no longer possible to present history as a single-track line reaching its terminus in the short-lived contemporary generation of a 'Chosen People'.

5. THE NEED FOR SIMULTANEOUS CULTIVATION OF PANORAMIC AND MYOPIC VISION

If the problem of quantity cannot be eluded by any device—not, for instance, by trying to narrow the field, and not by trying to subdivide it—we have to grapple with the stark difficulty of overcoming the disparity between the overwhelming mass of the data and the limited

¹ A. L. Kroeber: *The Nature of Culture*, pp. 10–11 and 19. Kroeber's suggestion that the anthropologists may be the pioneers in a coming general study of human affairs is taken up by Bagby. 'A future science of history must at first rely heavily on anthropology both for concepts and methods' (*Culture and History*, p. 20).

² This is why the 'master-activity' device is tempting (see Chr. Dawson: *The Dynamics of World History*, pp. 24–25).

³ See pp. 658–63.

⁴ F. Engel-Janosi observes that historians of the single-track school always think of themselves as 'being on the threshold of the Last Things' (*Wissenschaft und Weltbild*, 2. Jahrgang, Heft 4 (October, 1949), p. 270).

⁵ See pp. 110–13.

capacity of a single human mind. There is no escape from the formidable requirement that we must each of us attempt to take a panoramic view of the whole field;¹ and, considering how vast this is by comparison with our intellectual powers, we have to face the truth that our panoramic view is bound to be a superficial one.² Superficiality is a defect about which we cannot afford to be complacent, because it exposes us to the risk of misconstruing Reality,³ and the whole purpose of intellectual inquiry is to come as near as possible to seeing Reality as it is. How are we to correct our superficiality? The defeatist remedy is to avoid it by renouncing the panoramic view that exposes us to it; but this means renouncing the endeavour to arrive at any understanding of human affairs. A more constructive remedy is, not to seek to avoid superficiality at this prohibitive price, but to try to counterbalance it by aiming at thoroughness in some fraction of the total field.⁴ This fraction must be

¹ This point is well made by P. Bagby: *Culture and History*, p. 158. Ranke declared his belief that 'the final goal—not yet attained—always remains the conception and execution of a history of mankind' ('Das letzte Ziel, ein noch unerreichtes, bleibt immer die Auffassung und Produktion einer Geschichte der Menschheit'). This passage occurs in a fragment, written by Ranke in the eighteen-sixties and left by him in manuscript, which has been printed by A. Dove on pp. xiii-xvi (the passage just quoted is on p. xv) of his preface to the Ninth Part, Second Section, of Ranke's *Weltgeschichte* (published in nine parts, Leipzig 1881-8, Duncker and Humblot). As Ranke sees it, 'to comprehend the whole without failing to meet the requirements of exact research will, of course, always remain an [unachieved] ideal. It would entail a solidly grounded understanding of the entire history of mankind' ('Das Ganze zu umfassen und doch dem Gesetz der Forschung gerecht zu werden, bleibt freilich immer ein Ideal: es würde das Verständniss der gesammten Menschheitsgeschichte auf festem Grund und Boden in sich schliessen') (*ibid.*, p. xvi). 'In conversation with intimate friends, I have often considered the question whether there is any possibility of composing a world history on these terms. The conclusion was that to satisfy the highest demands is, no doubt, not possible, but that it is imperative that the attempt should be made' ('Im Gespräch mit vertrauten Freunden habe ich öfter die Frage erwogen, ob es überhaupt möglich sei, eine Weltgeschichte in diesem Sinne zu verfassen. Der Schluss war: den höchsten Anforderungen zu genügen, sei wohl nicht möglich, aber notwendig, es zu versuchen' (Ranke's own introduction to his *Weltgeschichte*, First Part, p. ix).

² J. K. Feibleman notes that a large picture of world history is bound to be based on secondary sources of dubious validity (*T'ien Hsia Monthly*, vol. xi, Nos. 1 and 2 (1940), p. 18). The Rev. E. R. Hardy Jr., too, observes that 'the impossibility of being equally expert in everything is a limitation that the universal historian must accept and work with. But', he continues *ad hominem*, 'I do feel that in the religious field Toynbee is not sufficiently aware of his own limitations.' 'In the field of religion it is not really possible to know more than one religion from the inside.' Toynbee has 'a sound textbook knowledge of Hinduism, Buddhism, and Islam; but is that really enough for writing with authority about their historical significance?' (*The Intent of Toynbee's History: A Cooperative Appraisal*). Apropos of my treatment of Indian history, culture, and religion, L. Renou sums up a friendly critique by pronouncing that I get at an external truth, but not at the 'vision' which comes from first-hand knowledge (*Diogenes*, No. 13 (Spring, 1956), p. 79).

³ For instance, Owen Lattimore points out, in *The Atlantic Monthly*, vol. 181, No. 4 (April, 1948), pp. 104-5, that 'dependence on secondary sources implies loss of an absolutely sure touch in distinguishing between the best secondary authority and an inferior authority, or in discriminating between the strong and weak points of a secondary authority who is on the whole good. One of the foredoomed limitations of scholarship, unfortunately, is that, when a bold and adventurous thinker like Toynbee takes over not only the facts but the ideas of a secondary authority, and projects them further, the projection is apt to reveal the flaws and weaknesses of the adopted ideas more than it enhances their strength.' Lattimore illustrates his point from my use of some of Ellsworth Huntington's ideas about the relations between the Nomadic culture and its physical environment.

⁴ I am grateful to Michael Postan for giving this good advice to me. In reviewing the first three volumes of this book, Postan remarks that 'the bulk of his new inventions are too wide and too vague to lead to a true sociological discovery, while the few which happen to provide openings for a truly original and a perfectly definite enterprise are left

small enough for us to be able to achieve thoroughness here without having to devote so much of our energies to this that we have not enough left over for taking even the most superficial panoramic view as well.¹ 'Critical method, objective approach, and comprehensive synthesis can and must go together.'² 'Critical research on the one side and comprehensive understanding on the other side can be counted on to give each other mutual support.'³

If we agree that the solution of the problem of quantity lies in combining the panoramic with the myopic view, perhaps we shall also agree that, in the present state of intellectual knowledge, understanding, and technique, we must be prepared to go to extremes in each of these two antithetical lines of attack on our problem. Considering the vastness of the current increase in the amount of what there is to know, our panoramic view must have the sweep of the view caught from the window of an aeroplane aloft in the stratosphere. Considering the minuteness of the current work that is being done by both the sociologists and the psychologists, our counterbalancing view must penetrate to the depth that is reached by a well-drilling apparatus. Since the radius of our panorama will be almost infinitely long, that of our drill-hole will have to be almost infinitesimally short. After all, when one is using a power-drill in quest of oil or water, it is a matter of course that one's drill-hole should have a shorter diameter than the shaft of a spade-dug well.

This counterbalancing intellectual activity of doing microscopic work on a minute area ought to be an effective insurance against succumbing to the danger inherent in the panoramic view's inevitable superficiality. If we know, from practice, what thoroughness is, we shall not mistake superficiality for it; and, if we see our superficiality for what it is, we shall at least be on our guard against the misconstruction of Reality to which it lays us open. Conversely, in our microscopic work, we shall be put on our guard, by our concurrent use of the telescope, against the misconstruction of Reality to which we are exposed by myopia. The crux of microscopic work is that its thoroughness within its own tiny area does not give the inquirer any information about the relations between this area and its setting in the general field of which it is a part;

unexplored'. Postan concludes that, 'until he writes a work of sociology'—meaning, as the context shows, a work of the microscopic kind—'he will not be able to rid himself of his vague images or to meet the challenge of his fruitful ones' (*The Sociological Review*, vol. xxviii (1936), pp. 56 and 63).

The same point is made in the Social Science Research Council's Committee on Historiography's Report (1954), p. 109. 'Toynbee's generalisations . . . must be elaborated to be testable propositions—an elaboration that the author does not provide.'

¹ It is, of course, a difficult question of judgement for an inquirer to decide, in the light of his particular objective, how much of his energy he should spend on telescopic work and how much of it on microscopic work. Christopher Dawson finds that there is too much telescopic work and too little microscopic work in the previous volumes of this book (*Toynbee and History*, p. 139). L. Mumford finds that I have 'succeeded better than most scholars in combining the methods of the specialist with those of the "generalist"' (*Diogenes*, No. 13 (Spring, 1956), p. 12).

² 'Kritik, objektive Auffassung und umfassende Combination zusammengehen können und müssen' (Ranke: fragment written in the eighteen-sixties, printed in *Weltgeschichte*, Ninth Part, Second Section, p. xvi).

³ 'Die kritische Forschung auf der einen, das zusammenfassende Verständniss auf der anderen Seite können einander nicht anders, als unterstützen' (Ranke: *Weltgeschichte*, First Part, p. ix).

and, unless and until one sees the object of one's study in its setting, one does not know or understand the object itself, however thoroughly one may have analysed its internal anatomy. An oil-pro prospector does not sink capital in a boring until he has made a wide geological survey of the whole region for which he holds a prospecting option. If he made a boring at random, and tried to judge its prospects exclusively on the materials brought to the surface by the drill out of this single narrow hole, he would soon lose his employer's money and his own job. A three-dimensional test would be a reckless undertaking without the guidance of a previous two-dimensional survey—just as, conversely, the two-dimensional survey would yield no precise knowledge of the contents of the sub-soil if it were not followed up by a three-dimensional test.

This means that the panoramic and myopic approaches do not only benefit, both alike, by being made concurrently, but need each other's complementary services so much that no inquirer can afford to neglect either of them. Either approach has its own inherent weaknesses; but the remedy for these weaknesses is, not to abandon the approach in which they arise, but to pursue the other approach as well. If we pursue both approaches at once, we shall be giving ourselves a chance of bringing the strong points of each of them to the rescue of the weak points of the other. On the other hand, if we sought to get rid of a weakness by abandoning the approach in which it arises, we should end by abandoning both approaches and consequently abandoning all inquiry.

This, in turn, means that inquirers who concentrate on the bird's-eye view and those who concentrate on the fly's-eye view are, not natural enemies, but natural, and indeed indispensable, allies. As Ranke puts it, 'research cannot be damaged by being brought into relation with a universal standpoint. Without the universal, research would lose its fire; without research, conception would degenerate into fantasy.'¹ If the specialist and the generalist were inevitable enemies, each would have to fight himself, as well as his colleague, since we have seen that, whichever of the two approaches may be the more attractive to a particular inquirer, he must also learn to follow the other approach, too, to some extent, as a means of insuring against falling into his preferred approach's pitfalls. Which of the two approaches is to be preferred by each of us is a matter of personal choice, and each of us will make his choice in accordance with his temperament. There is room, and need, for any number of inquirers of both schools. The one thing for which there is no room is civil war between them and within the bosoms of each of them. This necessity for concord and co-operation seems to be better understood, and better practised, at present by the students of non-human nature than it is by humanists. On this point, we humanists would be well advised to follow the good example set by inquirers in other fields.

¹ 'Die Beziehung auf ein Allgemeines kann der Forschung keinen Eintrag thun: ohne jenes würde diese erkalten, ohne diese die Auffassung in ein Hirngespinnst ausarten' (Ranke: fragment written in the eighteen-sixties, printed in *Weltgeschichte*, Ninth Part, second section, p. xvi).

V. THE NEED FOR A COMPREHENSIVE STUDY OF HUMAN AFFAIRS

THE demand for a comprehensive study of human affairs is inspired by several motives. Some of these are permanent and some temporary; some are disinterested, some self-regarding. The strongest and most estimable of these is curiosity. This is one of the distinctive traits of human nature. No human being seems to be altogether without it, though the degree of its strength varies enormously as between different individuals. In the field of human affairs, curiosity prompts us to seek a panoramic view in order to gain a vision of Reality that will make it as intelligible as is possible for a human mind. 'History certainly justifies a dictum of Einstein, that no great discovery was ever made in science except by one who lifted his nose above the grindstone of details and ventured on a more comprehensive vision.'¹ A panoramic view will at any rate be a less misleading reflection of Reality than a partial view.² And, while it is true that in the search for knowledge and understanding, as in all human activities, human achievements are never complete, it is one of Man's virtues that he has the intelligence to be aware of this and the spirit to go on striving, with undiminished zest, to come as near to his goal as his endowment of ability will carry him.

Another motive for the quest for a panoramic view of human affairs, and indeed of the whole of the phenomenal universe, is more self-regarding. The phenomena appear to be innumerable, and the Universe infinite, to the diffracting human mind; and this experience of being adrift in a boundless sea, without chart or compass, is terrifying for a being whose powers are finite. In this disconcerting human situation our first recourse is to make believe that the ocean is not as big as it looks; we try to play on it those tricks of partition and omission that have been noticed in the preceding chapter; but, in playing them, we see through them, and then the only recourse left to us is the formidable one of trying to fling our mental net over the Universe as a whole. Needham points out³ that 'one of the greatest stimulatory factors of primitive science' was 'the need for at least *classing* phenomena and placing them in some sort of relation with one another, in order to conquer the ever-recurring fear and dread which must have weighed so terribly on early men'. In the Sinic World this universal human response to the psychological challenge of the consciousness of infinity took the form of the development of a set of symbols—eight trigrams and sixty-four hexagrams—generated by working out all the possible permutations and combinations of sets of lines, some unbroken and some broken. These lines seem to have represented sticks—some short, some long—that had been used originally for magical operations. 'Originating from what was probably a collection of peasant omen texts, and accumulating a mass of material used in the practices of divination', this scheme of

¹ M. R. Cohen: *The Meaning of Human History*, p. 210.

² See E. E. Y. Hales, quoted on p. 647.

³ J. Needham: *Science and Civilization in China*, vol. ii, p. 336.

visual configurations, in its canonical presentation in the classic called *The Book of Changes (I Ching)*, 'ended up as an elaborate system of symbols and their explanations'.¹ 'What seems to show through' a number of passages in the commentaries on the *I Ching* by Chinese philosophers

'is the effort made by the School of Naturalists and the Han Confucians to erect the figures made by the long and short sticks into a comprehensive system of symbolism containing in some way all the basic principles of natural phenomena. Like the Taoists, they were looking for peace of mind through classification.'²

Primitive societies are not the only societies, and the Sinic is not the only civilization, in which an anxiety in the presence of infinity has spurred human minds to try to bring infinity under mental control. In the rise of Hellenic science, as in the rise of its Sinic counterpart, one of the stimuli was the urge to set bounds (*perata*) to a Universe that presented itself as boundless (*apeiron*). In the modern Western World the same anxiety has been rekindled on the academic level since the introduction of the Chinese system of grading intellectual ability by the test of written examinations—the more so because this innovation in Western education coincided in date with the sudden rapid increase, discussed in the last chapter, in the amount of what there was for examinees to know. A Westerner nowadays may have been educated, during fourteen or fifteen impressionable years, with the immediate object of passing successive examinations, and he may emerge from this ordeal in the state of mind of a perpetual examinee with an infinite number of things to learn and only one working lifetime before him for learning them—a hopelessly short term for acquainting himself with infinity, even if he were to make this his exclusive life-work.

Ad hominem, I still vividly remember my discomfort in emerging in this state of mind, in the summer of 1911, from the final examination at Oxford for the School of *Literae Humaniores*. I immediately started out to read all the surviving sources for Hellenic history in the Greek and Latin languages that I had not read already while I was preparing for the examination that I had now passed. I soon realized that, even if I succeeded in reading every word that there was to be read about Hellenic history both in Greek and Latin and in the languages of the modern Western World, I should be chasing a receding horizon that would lead me on, beyond Hellenic history, into the histories of all the other human societies within Western knowledge. This time the term of my penal servitude would be, not just two and a half years or fourteen; it would be the rest of my life, with the culminating examination postponed to the other side of death. Must I really spend the rest of my life living in fear of a post-mortem examination by Rhadamanthus? This was a melancholy state of mind to have fallen into on the threshold of adult life. I was delivered from it unexpectedly by finding myself making something out of the new knowledge that I was taking on board.

In the course of my post-examinational reading I had been comparing

¹ Ibid., p. 304.

² Ibid., p. 328.

facts and figures mentioned in Xenophon's continuation of Thucydides' history with facts and figures mentioned by Thucydides himself. These were data about the numbers and organization of the Lacedaemonian army at successive dates. I had been looking at these data synoptically, trying to make out the relation in which they stood to each other, and I now found that I had been unconsciously producing the nucleus of a paper on 'the Growth of Sparta'. This was something that I had never done before, and the realization that I had been doing it gave me immediate psychological relief. In doing something with the innumerable phenomena, I had 'fixed' them in the American usage of the verb 'fix' as well as in its literal meaning. I had found a pattern in the apparent flux, and, in finding this, I had made the flux less menacing to me. Of course, the little batch of data that I had managed to deal with in this way covered only a tiny patch of the boundless field of human affairs, but I had made a beginning. Now that I had 'fixed' one bit, I need not despair of being able to do the same with the rest. Without knowing it, I had taken the first step towards producing, not only a paper on Sparta, but the present book.

This anxiety in face of the phenomena spurs human minds, always and everywhere, into 'fixing' the phenomena by finding a pattern in them; but it has been accentuated in the present-day world as a result of the World's sudden unification by means of modern science and technology. The same unprecedented scientific and technological advances that have unified the World by 'annihilating distance' have put it into mankind's power to annihilate itself by making war with atomic weapons. We are now waking up to the truth that we have unintentionally put ourselves in a new position in which mankind may have to choose between the two extreme alternatives of committing genocide and learning to live henceforward as a single family.¹ The human race's survival is now once again in doubt for the first time since Man established his ascendancy over non-human nature—a feat that he achieved part way through the Palaeolithic Age. This time it is human nature that threatens mankind with extinction. The recurrence of the ancient threat from this new quarter is a challenge to all human beings to subordinate their traditional parochial loyalties to a new paramount loyalty to mankind itself. The recurrent threat's source in human nature is a challenge to us to study human affairs in order to bring them under control.

In a world that has been unified in both space and time, a study of human affairs must be comprehensive if it is to be effective.² It must

¹ Among many other contemporary observers, J. Romein testifies that, in our day, 'one world or none' is the truth about our situation (*Toynbee and History*, p. 350).

² This point has been made by Polybius in several telling, though perhaps unnecessarily polemical, passages of his *Oecumenical History*. Book I, part of chap. 4, Book III, chap. 31, and Book VIII, chap. 2, have been quoted in the present book already (in iii. 317, footnote 5, and x. 65-66). The whole of Book I, chap. 4, may be quoted here.

The coincidence by which all the transactions of the World have been oriented in a single direction and guided towards a single goal is the extraordinary characteristic of the present age, to which the special feature of the present work is a corollary. The unity of events imposes on the historian a similar unity of composition in depicting for his readers the operation of the laws of Fortune on the grand scale, and this has been my own principal inducement and stimulus in the work which I have undertaken.

include, not only the whole of the living generation, but also the whole of the living generation's past. In order to save mankind we have to learn to live together in concord in spite of traditional differences of religion, civilization, nationality, class, and race. In order to live together in concord successfully, we have to know each other, and knowing each other includes knowing each other's past,¹ since human life, like the rest of the phenomenal universe, can be observed by human minds only as it presents itself to them on the move through time. Historical forces can be more explosive than atom bombs.² For our now urgent common purpose of self-preservation, it will not be enough to explore our common underlying human nature. The psychologist's work needs to be supplemented by the archaeologist's, the historian's, the anthropologist's, and the sociologist's. We must learn to recognize, and, as far as possible, to understand, the different cultural configurations in which our common human nature has expressed itself in the different religions, civilizations, and nationalities into which human culture has

'I have also been influenced by the fact that no contemporary writer has attempted to put together a comprehensive account of world affairs. If there had been anyone else in the field, I should have felt far less urge to enter it myself. Actually, however, I see many specialists writing works about local wars, including some of the political transactions connected with these, but, so far as I know, nobody even attempting to make a general examination and synthesis of the configuration of contemporary events by tracing these back to their origins and explaining how they reached their consummation. This spectacle has made me feel an imperative call not to leave unrecorded, and not to let slip unheeded, a transaction that is surely the foremost and the most beneficial of all that stand to Fortune's credit. No doubt she is never tired of innovating and is continually putting her spoke in the wheel of human affairs. But the *tour de force* that she has achieved in our time is quite without precedent; and it is also something that could never be gathered from a study of the works of the specialist historians.

'What should we say of somebody who visited the World's famous cities one by one—or, if you like, just took a look at separate pictures of them—and then immediately assumed that, by this process, he had acquired a knowledge of the physiognomy of the whole World, including its entire layout and structure? People who are convinced that historical specialisation will give them a fairly good synoptic view of the whole of history are, it seems to me, suffering from a delusion. They remind me of people who have taken a look at the *dissecta membra* of an organism that was once alive and beautiful, and who then imagine that they have had a first-hand view of this creature in all its activity and beauty. We have only to suppose that someone promptly rehabilitates the creature, body and soul, in its original unity and perfection, and then displays it again to the same spectators. Surely these would all then admit that, at the first view, their vision of the object had fallen far short of the reality and had been more like what one sees in a dream. The truth is that the part may give us a notion of the whole, but will never give us a genuine knowledge or an accurate appreciation of it.

'On these analogies, we must conclude that the work of the specialist historians makes a singularly small contribution to an intimate and trustworthy insight into history as a whole. The only way of arriving at this is to grasp the mutual inter-connexions and inter-relations of all the phenomena, together with their likenesses and differences. A panoramic view of this kind enables one to find utility as well as enjoyment in history.'

¹ This point is made by Diodorus of Agyrium in the following passages (Book I, chaps. 1 and 3) of the Preface to his *Library of Universal History*: 'We are indebted to these authors [i.e. the authors of universal histories] for their efforts to marshal the whole human race, who are all members one of another, in spite of the barriers of space and time, in one magnificent array. In attempting this, they have constituted themselves nothing less than the servants of Providence. God, in His Providence, has related in a single system the evolutions of the stars of heaven and the characters of men, and maintains them in perpetual motion to all eternity, imparting to each the lot which Destiny assigns; while the authors of universal histories, in their works, record the general transactions of the World as if it were a single community, and pass the works of Providence through the grand audit of their clearing-house. . . . In short, the superiority of this branch of history over the rest is to be measured by the superior utility of the whole to the part and of continuity to discontinuity.'

² L. C. Stecchini in *Midstream*, Autumn, 1956, pp. 84-91.

come to be articulated in the course of its history. 'All of human history is relevant to present and future human needs.'¹ 'The knowledge of the history of mankind should be one of mankind's common possessions.'²

We shall, however, have to do more than just understand each other's cultural heritages, and more even than appreciate them. We shall have to value them and love them as being parts of mankind's common treasure and therefore being ours too, as truly as the heirlooms that we ourselves shall be contributing to the common stock. Without the fire of love, the dangerous fissures in mankind's social solidarity cannot be annealed. Danger, even when it is as extreme as ours is today, is never a sufficient stimulus in itself to make men do what is necessary for their salvation. It is a poor stimulus because it is a negative one. A cold-blooded calculation of expediency will not inspire us with the spiritual power to save ourselves. This power can come only from the disinterested pursuit of a positive aim that will outrange the negative one of trying to avoid self-destruction;³ and this positive aim can be given to men by nothing but love.

In mankind's present situation a demand for a comprehensive view of human affairs is to be expected. Indirect evidence that this demand is, in fact, being made today comes to light incidentally in some of the critiques of earlier volumes of the present book. Some of this evidence carries conviction, because it is the testimony of critics who hold that the book has had a more favourable reception than it deserves. They explain this lack of judgement, as it seems to them, on the public's part by suggesting that people are now making this demand for a comprehensive view and that they have welcomed my work uncritically because they feel that it is at least giving them something of what they want.

R. V. Chase, for example, suggests⁴ that 'persuasive theorists do not . . . exert their strongest influence because of the logical air-tightness of their theories, but rather because they fill an unconsciously felt vacuum with the force and urgency of their moral passion'. Tangye Lean sees⁵ me performing the role of an exponent of a particular cultural situation, embodying my contemporaries' anxiety over the problem of existence, their obsession with the spectacle of decay, which brings them face to face with death, and their burning desire to find some way of overcoming their own transitoriness and securing immortality. As A. G. Bailey sees it,⁶ 'clearly this book answered a deep-felt need of people beset with the anxieties and uncertainties of the twentieth century'. Christopher Dawson suggests⁷ that one reason why my work has found some accept-

¹ R. Coulborn in *Phylon*, 1940, offprint, p. 62.

² 'Die Erkenntnis der Geschichte der Menschheit soll ein Gemeingut der Menschheit sein': a fragment, written by Ranke in the eighteen-sixties, printed on pp. xiii-xvi of A. Dove's preface to the Ninth Part, Second Section, of Ranke's *Weltgeschichte* (Leipzig 1881-8, Duncker and Humblot, 9 parts). The passage here quoted is on pp. xv-xvi.

³ In a critique of my work, J. Romein judges that I am right in thinking that the unity of the World is now in the making. As Romein puts it, world unity has been created by the technicians; we have now to raise this technological unity to the level of creativity (*Toynbee and History*, p. 350).

⁴ In *The American Scholar*, vol. 16, No. 3 (Summer, 1947), pp. 281-2.

⁷ In *Toynbee and History*, p. 129.

ance is because it is a study of the civilizations. These have now become realities that cannot be ignored. J. F. Leddy suggests¹ that it is because people in our time want to see the World as a whole and to find some meaning in its history. J. Romein says² that my work is valuable in giving a real world-view, and that I have done something to help in overcoming the opposition between East and West. H. Kohn says³ that a sense of unity will be my contribution to an understanding of things. T. J. G. Locher finds⁴ that 'our age is asking for a total vision, now that the World has grown together into so close a unity. This super-human task is the one at which Toynbee has tried his hand.'⁵ Other critics, too, have made the point that I have tried to take a comprehensive

⁵ If Pieter Geyl ever reads this page, the passages here quoted from observations made by some of his fellow critics of my work may throw light on something that has apparently puzzled him. He, too, has noticed that my work has been not badly received by the non-professional public, and this seems to have left him perplexed. 'This chorus of praise', he remarks, 'is a chastening reminder of the very restricted influence exercised by professional criticism' (*Toynbee and History*, p. 377). If the 'chorus of praise' has been evoked by my attempt to take a comprehensive view of history, this gives Geyl his cue. He and my other critics have only to try their hands at the same enterprise, and the chorus will give them the same grateful welcome, even if they make no more of a success than I have made of the effort to see human affairs as a whole and to find some meaning in them.

This suggestion, will, I fancy, draw from some of these critics the retort that they do not want praise from the public at any price, and certainly not at the price of doing anything so unprofessional as to take a panoramic view of things. In their eyes popularity is incriminating. My kind interpreter Crane Brinton has done his best to exonerate me from this imputation. 'It is quite clear', he testifies, 'that his fame is everywhere confined . . . to high-brows and middle-brows, and has not reached the low-brows, as it would have to do if he is to do the work of a major prophet. It is very hard indeed to think of Toynbee effectively translated to the many, as Marx has certainly been translated' (*The Virginia Quarterly Review*, Summer, 1956, pp. 361-75). Marx is vulgar indeed. His shamelessly panoramic view of human affairs has caught the *profanum vulgus's* imagination all over the World. I have not incurred that damning degree of popularity, anyway. Yet I fear that even a modest popularity among the high-brow and middle-brow fraction of the public is enough to ruin my reputation with the professionals. E. Fieser notes disapprovingly that 'popularity is no substitute for understanding', though he does concede that 'all discourse is in some sense a simplification' (*Toynbee and History*, p. 378). H. J. Morgenthau and A. J. P. Taylor draw attention (*ibid.*, pp. 196-7 and 115) to the contrast between a popularity that they ascribe to me with the public and the condemnation that I have received from my fellow historians. Both of them assume, without arguing the point, that, on any issue between public and professionals, the professionals must be right. Morgenthau chivalrously testifies that I am not being popular on purpose. 'This popularity is unjust', he writes, 'to Mr Toynbee's intent, but it illuminates the weakness of his achievement' (*ibid.*, p. 197). It is true that I have never set out to win popularity, any more than I have sought to avoid it. When I am writing, the reception that is awaiting me is not in my mind. I write as the subject moves me. But surely the truth about popularity is that, in itself, it is no evidence of merit or demerit. One must know the reason why a book is popular before one can judge whether, in the particular case in point, popularity damns the author or does him credit. Morgenthau evidently holds that popularity, whatever its cause, damns an author and his work automatically. This dogma seems to rest on two assumptions: that the judgement of the public must always be wrong, and that the judgement of the professionals must always be in conflict with it.

If these are the doctrines of a professional, they are unfortunate. In what we vaguely call 'the public', there are many different levels of intellectual cultivation; and, if a professional despises all these levels indiscriminately, he is putting himself in jeopardy, for at the higher levels he is likely to find his intellectual equals, and may even find his superiors in the field outside the contemptuous specialist's own chosen province. What is more, the contemptuous specialist is doing a disservice to the culture that ought to be common to the cultivated public and to him. When professional intellectual work becomes esoteric, this is a sign that culture is in a bad way. Culture flourishes only when there is an active and constant intellectual intercourse and exchange of ideas between cultivated people of all kinds.

view of history, without going into the question whether my work has been well received, or whether, if it has been, its attempt at comprehensiveness is what has won it favour. The purpose for which the point is made by most of them is to go on to say—as Locher does in the passage from which I have just quoted—that, in attempting this, I have obviously attempted the impossible, or that, for whatever reason, I have failed to achieve my aim.¹ If the critics quoted in the present paragraph are right in holding that my work has been well received and that its attempt at comprehensiveness accounts for this, then the other testimonies to this attempt at comprehensiveness indirectly give further support to the view that there is a genuine demand for such attempts in the present-day world.

One of my critics has compared earlier volumes of this book to a 'palace' in which 'the rooms . . . are over-furnished to the point of resembling a dealer's warehouse'.² This reviewer must also be a thought-reader; for I have often thought of myself as a man moving old furniture about. For centuries these lovely things had been lying neglected in the lumber-rooms and attics. They had been piled in there higgledy-piggledy, in utter disorder, and had been crammed so tight that nobody could even squeeze his way in to look at them and find out whether they were of any value. In the course of ages they had been accumulating there—unwanted rejects from a score of country houses. This unworthy treatment of these precious pieces came to trouble me more and more; for I knew that they were not really junk; I knew that they were heirlooms, and these so rare and fine that they were not just provincial curiosities; they were the common heritage of anyone who had any capacity for appreciating beauty in Man's handiwork. At last I found that I could not bear this shocking situation any longer, so I set my own hand to a back-breaking job. I began to drag out the pieces, one by one, and to arrange them in the hall. I could not pretend to form a final judgement on the order in which they should be placed. Indeed, there never could be a final judgement on this, for a number of attractive different orders could be imagined, each of them the right order from some particular point of view.³ The first thing to be done was to get as many of the pieces as possible out into the open and to assemble them in some order or other. If once I had them parked down in the hall, I could see how they looked and could shift them and re-shift them at my leisure. Perhaps I should not have the leisure; perhaps the preliminary job of extracting these treasures from the lumber-rooms and attics would turn out to be as much as I could manage with my single pair of hands.⁴ If so, this would not matter; for there would be plenty of time afterwards for other people to rearrange the pieces, and, no doubt, they would be doing this again and again as they studied them more closely and came to know more about them than would ever be known by me.

³ See further p. 168.

⁴ 'His work is a gigantic labour—the labour of a comprehensive attempt to put things in order (*Die Riesenarbeit seines Werkes ist eine umfassende Ordnungsarbeit*)' (H. Werner in *Deutscher Vierteljahrsschrift für Literaturwissenschaft und Geistesgeschichte*, 29. Jahrgang, xxix. Band (1955), p. 544).

This furniture-shifting job is, of course, David's kind of work, not Solomon's; and the time when Solomon's achievement will be feasible is now only just dawning.

"There is as yet no history of humanity, since humanity is not an organised society with a common tradition or a common social consciousness. All the attempts that have hitherto been made to write a world history have been in fact attempts to interpret one tradition in terms of another, attempts to extend the intellectual hegemony of a dominant culture by subordinating to it all the events of other cultures that come within the observer's range of vision."¹

This has certainly been true up to now. It is true, for instance, of the presentation of world history in the Old Testament, in Hellenic literature, in the Chinese dynastic histories, and in Western historians' works. If a Western historian does not fall into the egocentric error of making all history lead up to the point reached in the West in his own generation, he is likely to fall into another error, only one degree less egocentric, with which I, for instance, have been charged, with some justice, by a number of my critics.² He is likely to use Hellenic history, which lies in the background of his own Western history, as an exclusive 'model', not just as one out of a number of alternative possible models, for elucidating the configuration of history in general in the current age of the civilizations.

Since the World is now being unified as a result of Western inventions, and therefore, initially, within a Western framework, one or other or both of these characteristic Western distortions of the true picture of world history are likely to persist for some time and to die hard. Nevertheless, it is already possible to look forward to a time when these Western distortions of the true picture, and all other distortions of the kind, will be replaced by a new vision of the past seen from the standpoint, not of this or that nationality, civilization, or religion, but of a united human race. If mankind does respond to the challenge of its present self-imposed ordeal by saving itself from self-inflicted genocide, this will have been the reward of a common effort to transcend all the traditional divisions and to live as one family for the first time since mankind made its first appearance on this planet. This *union sacrée* in the face of imminent self-destruction will be, if it is achieved, Man's finest achievement and most thrilling experience up to date. From the new position of charity and hope which Man will thereby have won for himself, all the past histories of the previous divisions of the human race will be seen, in retrospect, to be so many parts of one common historic heritage. They will be seen as leading up to unity, and as opening out, for a united human race, future prospects of which no human being could have dreamed in the age of unfettered parochialism.

VI. THE PROBLEM OF ORGANIZING A COMPREHENSIVE STUDY OF HUMAN AFFAIRS

I. THE USE AND ABUSE OF SIMPLIFICATIONS

THE enterprise of trying to organize a comprehensive study of human affairs is still in its pioneering stage. The pioneer's task is to open up the jungle by blazing trails. If he does this well, he will have opened the way for his successor the surveyor.

To do well in this preliminary reconnaissance work means satisfying two requirements. The trails must follow the lie of the land, and the blazing must be clear enough to give guidance to the next comer. The trails must link up the key points in the landscape by the shortest practicable routes. The blazing must be unmistakable. If the pioneer is literate, he will chart his trails and his blazes on a sketch-map; and as a map-maker he enjoys a licence. His task is the practical one of ensuring, as far as may be humanly possible, that the next comer shall not miss the way that the pioneer has found and has opened up. Therefore, in drawing his sketch-map for the next comer's use, the pioneer may take it upon himself, at his own discretion, to simplify the pattern and to exaggerate the prominence of the outstanding features of the landscape. He may take these liberties legitimately on two conditions. The first is that he must limit these deliberate cartographical distortions of Reality to the minimum necessary for his purpose of giving plain guidance. The second condition is that he must not try to pass his sketch-map off as being anything but what it is. He must make it clear that it is a sketch, not a survey, and that it is therefore not definitive but provisional. He must, in fact, note on it a warning for all future users that it not only may be superseded, but will be, and will be soon. It will be superseded the sooner, the better the pioneer has done his work; for, the better he has done it, the faster the legion of surveyors will be able to follow his reconnaissance up by triangulations that may prove to be at least 'semi-permanent'.

Pioneers are not the only map-makers to whom the pioneer's licence is customarily allowed. It is also granted to the modellers of relief-maps, though these, unlike pioneers in the wilderness, have all the resources of science and technology at their disposal in their workshops. Relief-map modellers sometimes deliberately misrepresent Reality by presenting altitude out of scale to area, and they do this for the reason that leads a pioneer to misrepresent Reality on his sketch-map by simplifying it. Their first concern, like his, is to give the users of their map clear guidance; and a relief-map that did not exaggerate altitude out of proportion to area would give little more guidance than a two-dimensional map would give. It is well known that a model of the globe, with the unevenness of its surface reproduced in scale with the extent of its area, would look no rougher than an unpeeled orange. The differences in altitude between mountains and valleys, plateaux and plains, would be difficult to discern without the aid of a powerful magnifying-glass

and would be less legible to the finger than the embossed lettering in a braille book. The heights and depths must be exaggerated, quite out of scale with the area of the globe's surface, if a relief-map is to be serviceable. It is therefore mere common sense to model a relief-map in these disproportionate dimensions. This is, however, legitimate only if the modeller takes care not to leave the prospective user under any misapprehension. He must make a declaration of the scale on which the heights and depths are shown in his model, and of how this stands to the scale as it is in Nature; and he must display this schedule prominently enough for it to be impossible for a user to overlook it.

In previous volumes of this book I have allowed myself the pioneer's and relief-map modeller's licence, and I make no apology for this. If I had not done it, I should not have been able to find my own way, not to speak of giving myself a chance of providing guidance for anyone else. I do, however, plead guilty to not having signalled to my readers what I was doing. I was hardly conscious of this myself, since my mind was all the time intent, first and foremost, on bringing out the salient features in the vast landscape that I was trying to explore. I have paid the penalty of being censured, both in general and over particular points, for having tacitly made the features more salient in my model than they are in Nature.

No doubt all thinking is a mental fission of a unitary Reality.¹ J. Romein recognizes² that 'every theory is simplifying and contracting', and E. Fiess, in still wider terms, that 'all discourse is in some sense a simplification'.³ But C. Trinkaus pronounces⁴ that the simplifications in my formulae are too crude; and T. J. G. Locher likewise finds⁵ that my presentation is too simple, one-sided, and subjective, and that I push my points too far. E. I. Watkin passes the same judgement⁶ with a philosopher's discrimination.

'We believe that there are patterns in human history, and we are convinced that Professor Toynbee has discerned a pattern, a rhythm which does in fact exist, and has assigned many true causes at work to produce it. But we also think that the complication of factors in human history is so great that no pattern is repeated so regularly and is so clearly discernible as Professor Toynbee maintains. . . . In many respects we prefer Mr Dawson's simpler scheme. . . . That is not to say that we think Christopher Dawson's scheme, or indeed any other, is to be simply accepted in place of Arnold Toynbee's. None is wholly false, none wholly true. All are more or less partial views of a pattern more complex than any, but also, for that very reason, more imperfect.'

I will give some examples, noticed by my critics or by me or by both, of distinctions, contrasts, or turning-points that come out sharper, in my presentation of them, than they are, perhaps, in reality.

The primordial dichotomy is the distinction between consciousness and the subconscious level of the psyche. It is primordial because it is

¹ See Chapter I, *ad init.*

⁶ In *The Tablet*, 12th August, 1939.

consciousness that generates our awareness of the phenomenal universe. It would seem, then, that the frontier of consciousness ought to be delineated firmly, but 'firmly' is not, of course, the same thing as 'sharply'. The border between consciousness and the unconscious or subconscious may be, in reality, more like a threshold (*limen*) than like a demarcation line (*limes*). M. Savelle observes¹ that the line between subconscious impulse and purely intelligent choice or planning is not, in truth, a sharp one. M. R. Cohen notes² that we must not ignore either the unconscious or the states intermediate between unconsciousness and consciousness.

In applying the myth of challenge-and-response³ I may sometimes have drawn too sharply the distinction between the two parties to the encounter. I have, though, taken account of the truth that the parties are not necessarily in reality the separate individual personalities that they are represented as being when they are brought on to the stage as *dramatis personae* in a mythological drama. I have cited⁴ Saint Paul's *Epistle to the Romans*, chapter vii, verses 24-25, as an example of the drama's taking the form of an encounter between conflicting spiritual forces within a single soul. If we depersonalize the word 'encounter' by calling it 'dialectical interaction',⁵ it is evident that this can take place between two or more entities of a number of different kinds. It seems, indeed, to be one of the fundamental rhythms of Reality as this presents itself to human minds. It is also, I believe, characteristic of the pattern of dialectical interaction that it should be serial—one transaction leading on to another, and this to another again—and that, if and as the chain of dialectical interactions prolongs itself, there is a tendency for the field of action to be transferred from the outer to the inner world of the party responding to this succession of challenges.⁶

One of the types of encounter to which the myth of challenge-and-response applies is the interaction between Man and his environment, both human and non-human.⁷ M. Postan observes⁸ that the notion of challenge-and-response 'might have enabled Professor Toynbee to proceed much farther than the biologists and sociologists have so far done in abolishing the artificial abstraction of the object from the environment'. J. K. Feibleman remarks⁹ that I have discovered, in discussing the genesis of civilizations, that 'human society is only for certain narrow purposes a valid isolate', but that I then drop this discovery and try to explain all human affairs from inside. O. H. K. Spate makes the same criticism with greater precision. "Environment taken by itself" is a meaningless phrase; without Man, environment does not exist.¹⁰

¹⁰ *The Geographical Journal*, vol. cxviii, Part 4 (December, 1952), p. 419. The same point is made in the Social Science Research Council's Committee on Historiography's Report (1954), p. 119. 'No product of Nature can be considered a natural resource until

There is a danger of setting up a false duality and so creating chicken-and-egg questions of priority.¹ Toynbee and Ellsworth Huntington 'both fall into the fallacy that there is, or can be, such a thing as environment "taken by itself"'.² 'The facts of geography are the facts as they are approached. . . . This world, without Man, is not environment, is not our world'³—and, in illustration of this point, Spate cites⁴ the 'piscine geography' so brilliantly and amusingly sketched by Rupert Brooke in a poem in which the key-note line is: "'There shall be no more land" say fish.' In reality, as Spate points out,⁵ 'environment' always means 'the environment of people x ', 'and x is a variable, even if the environment is not'.⁶ 'The environment affects us through the idea formed of it.'

Spate's critique is penetrating and conclusive. It immediately calls to mind a number of dramatic illustrations of its truth. For example, the nineteenth-century diplomatists' idea of a desert was that it was a region of no economic or political value because it was incapable of supporting life. Accordingly, while they were prepared to haggle, and, in the last resort, to go to war, over a few square metres in Alsace or Oregon, they amicably partitioned the Arabian Desert and the African Sahara by blithely drawing straight lines of enormous length across small-scale maps. In this cavalier way they disposed of the sovereignty over vast areas which, in the atlases of the day, were the 'perfect and absolute blank' commended as the ideal kind of map by the Bellman in Lewis Carroll's *The Hunting of the Snark*. During the late-nineteenth-century partition of Africa between European states there was an occasion on which Lord Salisbury—under fire in the House of Commons at Westminster for having acquiesced in the annexation of startling numbers of African square kilometres by France—made the celebrated reply that most of this territory that he had let slip was 'very light soil'. Some of it, however, was the soil under which the French oil-prospectors have recently discovered what they believe to be rich oil-bearing strata; and the time has long ago passed when diplomatists negotiating international frontiers in either the Sahara or Arabia were carefree. The desert-girt Buraymi oasis is at this moment an object of acrimonious dispute between the governments of Sa'udi Arabia and Great Britain. The 'idea formed' of a desert has in fact been transformed—in regions in which deserts overlie an oil-bearing subsoil—by the late-nineteenth-century discovery of the economic value of mineral oil and the twentieth-century development of techniques for tapping it at ever greater depths below surface-level. The Arabian desert is just as inhospitable to life today as it ever was, yet it has now become a key part of the environment of the peoples of Western Europe. Similarly, in the second

Man wants it for his use and has techniques for exploiting it. Thus rich, swampy land is not a natural resource unless men can drain it and cultivate it; nor were coal, gold, or uranium ore of any importance until Man worked them and had means of using them.'

¹ *The Geographical Journal*, vol. cit., p. 419.

² *Ibid.*, p. 419. H. and M. Sprout also make the point that 'environment is a relative term, not an absolute one' (*Man-Milieu Relationship in the Context of International Politics*, p. 17).

³ *Ibid.*, p. 419, footnote 2.

⁴ *Ibid.*

⁵ Spate, loc. cit., p. 419.

⁶ *Ibid.*, p. 411.

⁷ *Ibid.*, p. 423.

century B.C., the forest-clad Po Basin, which had been a wilderness for Gallic squatters in its glades, was transformed into a new Italy by Roman peasant pioneers who approached it with the tools and the will to cut down the trees and plough the fertile soil that the Romans' Gallic predecessors had never dreamed of disputing with the native oakwoods.¹ This Old-World tale has been repeated in North America within the last three centuries. The forests in which the pre-Columbian human fauna had been content to cultivate the glades, and the prairies on which they had been content to hunt the buffalo, have been brought under the plough by Roman-hearted West European invaders. In truth, 'unto everyone that hath shall be given, and he shall have abundance; but from him that hath not shall be taken away even that which he hath'.²

In reality, then, the distinction between a challenging environment and the people challenged by it is a fiction of mythology. 'The facts are as approached.'³ The environment is not just another name for its material constituents. It means these material constituents as they appear to human beings who have—or have not—the will and the means to master them. Everything within a human being's physical reach and mental range is part of that human being. His self is, in fact, potentially coextensive with the Universe.⁴ If Man's environment were really distinguishable as a separate entity from Man himself, Man's mastery of his environment—an achievement on which his existence depends—would never have been a possibility, any more than a human mind could apprehend phenomena, or God create the World, if there were really a great gulf fixed between the parties to these two other kinds of encounter. Logically, then, I have been put in the wrong. To draw the vulgar distinction between Man and his environment is scientifically inadmissible. I confess my sin, but must continue to commit it, and this for the reason that compels Spate himself to commit it in company with me. The reason is that, in the study of geography, as in all other kinds of thinking and creation, to tell the absolute truth about Reality is to say the last possible word, and therefore to debar oneself from all further research, discovery, and increase in understanding. Man and his environment are fictitious products of an unwarrantable mental fission of a monolithic Reality. This may be the truth, but the declaration of it puts a full stop to all further thinking about human affairs. In fact, the proof of Spate's proposition is double-edged. *Quod erat demonstrandum* turn out also to be *quod est absurdum*. The truth is that 'segmentation is humanly inevitable, i.e. essential to sane observation'.⁵

Five other distinctions that I have drawn too sharply—as I have now come to believe, on reconsideration—are those between leading minorities and the masses, between minorities that are creative and those that are merely dominant, between creativity itself and uncreativity, and

¹ See Polybius: *Historiae*, Book II, chaps. 15 and 35.

² Matt. xxv. 29. Cp. Matt. xiii. 12; Mark iv. 25; Luke viii. 18; and Luke xix. 26.

³ Spate in loc. cit., p. 423.

⁴ H. and M. Sprout point out, in *Man-Milieu Relationship in the Context of International Politics*, p. 18, that a single human being is the ultimate 'enviored unit'.

⁵ M. R. Cohen: *The Meaning of Human History*, p. 107.

between inspiration and mimesis, and between originality and diffusion. These distinctions, too, are, I believe, indispensable instruments for mental operations with human affairs.¹ I also believe that they are valid as far as they go, but I admit to having sometimes pushed them farther than is legitimate.² The differences between individuals in point of character and ability are evidently great enough to be a factor of capital importance in the determination of the course of human affairs. But all magnitudes are relative; and I could not maintain with any conviction, even if I wanted to, that the magnitude of these innate differences between individuals is so great as to require us to sort out mankind into what, in effect, would be two or more different species.³ I believe in the uniformity of human nature, as well as in the uniformity of Nature in general, and I hold this belief in two senses. I believe that the likenesses between the 'finest' and the 'crudest' specimens of the *genus homo*—supposing that we can define what we mean by 'fine' and 'crude' in this context—are greater and more pertinent to the conduct of social relations than are the differences between them. I also believe that these innate individual differences, such as they are, are distributed evenly, on the average, among all the so-called races into which mankind has been classified on the basis of physical criteria.⁴ It goes without saying that they are distributed evenly as between the members of different social classes;⁵ as between the partakers in the different cultures; and as between the adherents of the different higher religions. I also admit that

¹ E. F. J. Zahn judges that, in my handling of 'creative minorities', I have fallen into the error of 'hypostatizing an heuristic principle' (*Toynbee und das Problem der Geschichte*, p. 28). C. Trinkaus holds that I take refuge in 'the myth of creative personalities' and give 'no real analysis of social relations based on historical data' (*Science and Society*, vol. xii, No. 1 (1948), pp. 218–39).

² C. Trinkaus makes a general indictment of the sharpness of my distinction between 'creative' and 'uncreative' in loc. cit. H. Becker judges that I give too much prominence to individuals and to minorities (*The Annals of the American Academy of Political Science*, vol. 210 (July, 1949), p. 161). A. H. Hanson rejects my concept of 'creative minorities' in toto (*Science and Society*, No. 13 (1949), pp. 118–35). Chr. Hill notes that the true creators are 'the inventors and artists whose brains [the] ruling class picks' (*The Modern Quarterly*, Autumn, 1947, p. 299).

³ E. F. J. Zahn, commenting on Henri Bergson, *Les Deux Sources de la Morale et de la Religion*, p. 300, justly observes that there is dimorphism, in Bergson's meaning of this word, in each of us: i.e. each of us has something in him of the capacity to lead as well as of the capacity to follow (Zahn, op. cit., p. 28, footnote 62). I agree with R. Coulborn (in *Phylon*, 1940, reprint, pp. 35–36) that there is no sharp distinction between leaders and followers. Coulborn attributes to me (*ibid.*, p. 57) 'the false premise that ordinary men lack the power of creation'. I agree that this premise is false. I have never entertained it. But I may sometimes have used language that made it look as if I did. Coulborn is justified in asking (*ibid.*, p. 28) what I mean by saying that creative individuals 'are superhuman in a literal and no mere metaphorical sense' (iii. 232). Here I was echoing—but, in the act, exaggerating—Bergson's dictum that 'the apparition of each of these souls has been like the creation of a new species' (Bergson, op. cit., pp. 96–97)—and this dictum is itself an exaggeration, as, on reconsideration, I now believe (see p. 568 of the present volume, footnote 2). I have thus exposed myself to suspicions that I am a fascist, though, of all current ideologies, fascism is the most odious to me, and I entirely agree with Coulborn (*ibid.*, p. 58) in seeing, as the ideal, 'the maximum freedom for the creative urge of all men and the strongest unity of spirit between men'. Trinkaus, for instance, finds, in my theory of mass-mimesis, 'a disguised theory of social domination' (loc. cit.). F. Engel-Janosi, too, catches a fascist note in my accentuation of the role of minorities (*Wissenschaft und Weltbild*, 2. Jahrgang, Heft 4 (October, 1949), p. 269).

⁴ This point is made by A. L. Kroeber in *The Nature of Culture*, p. 42, and by W. Altree in *Toynbee and History*, p. 269.

⁵ R. Coulborn makes the perhaps rather obvious point that creativity is not confined to people who happen to be at the top of the social hierarchy (*Toynbee and History*, p. 182).

no minority that has taken a lead has ever succeeded in doing this solely in virtue of its creativity and through the charm exerted by the attractiveness of this. Even the least domineering leadership has never been able to dispense entirely with some element of force,¹ though it is also true that, conversely, even the most domineering leadership has never been able to maintain itself by force alone without some minimum degree of consent on the part of the governed. In previous volumes of this book I have, I think, underrated the effect of force in human affairs.² I need not go into this point here, as I deal with it in another place in this volume.³ For the same reason, I also need not here go into my antitheses between 'inspiration' and 'mimesis'⁴ and between originality and diffusion, except to mention, by anticipation, that both antitheses have been bridged by a middle term: A. L. Kroeber's suggestive concept of 'stimulus diffusion'. This, too, is dealt with in this volume in another place.⁵

I have also drawn too sharp a dividing line between 'civilizations' and 'primitive societies'⁶ and have confounded with each other, under the sweeping term 'primitive', different kinds of societies that have as good a claim as the civilizations have to be treated as distinct species.⁷ The development of human culture has, in fact, been a movement in which there have been more than just two steps. Civilization has been heralded in the Old World by a Neolithic type of culture, and in the Americas by a 'Formative' type, that were transitional between earlier types of culture and the civilization into which the Neolithic and the 'Formative' culture respectively blossomed.⁸ It might be judged—though such judgements are inevitably subjective—that the cultural transformation through which the Neolithic and the 'Formative' culture came to be superseded by the culture that we call 'civilization' was less revolutionary than the previous transformation through which these transitional cultures themselves had emerged from the Palaeolithic. The sharpness of the transition from the Neolithic culture to the Old-World civilizations of the first generation was mitigated by an intermediate culture, the Chalcolithic; and both the Old-World Neolithic culture and the

¹ I have been criticized for underrating the role of force in leadership by G. Masur in the *Historische Zeitschrift*, Band 174 (1952), pp. 269-86, and by M. Watnick in *The Antioch Review*, No. 7 (Winter, 1947-8), pp. 587-602.

² A. H. Hanson submits that violence has been coeval with civilization (*Science and Society*, No. 13 (1949), pp. 118-35).

³ See the Annex to Chapter II, pp. 612-15.

⁴ O. Handlin rejects this antithesis (in *The Partisan Review*, July-August, 1947, pp. 371-9); and R. Coulborn makes the point that it is an unreal one (*Toynbee and History*, pp. 152-3). 'The whole art of moral education', he justly remarks, 'is to inspire and drill simultaneously'. We are all, all the time, seeking examples and at the same time serving as examples to other people (Coulborn in *Phylon*, 1940, offprint, pp. 21-30). My comment on this is that two different activities are not proved to be one and the same as a result of its being shown that they are carried on side by side.

⁵ See pp. 343-5.

⁶ See Chr. Dawson: *The Dynamics of World History*, pp. 423-4, and Toynbee and *History*, p. 137; A. L. Kroeber in *The American Anthropologist*, vol. 53, No. 2 (April-June, 1951), pp. 279-83; C. Trinkaus in *Science and Society*, vol. xii, No. 1, p. 238.

⁷ I agree with P. Bagby (*Culture and History*, p. 159) that the distinction between 'civilized' and 'primitive' needs clarifying. J. K. Feibleman justly criticizes me (in *T'ien Hsia Monthly*, vol. xi, Nos. 1-2 (1940), p. 24) for having ignored the possibility that there may have been an intermediate stage between primitive societies and civilizations.

⁸ See Chapter IX, pp. 327-43.

American 'Formative' culture were certainly more akin to the civilization by which they were followed than either of them was to the Early Palaeolithic Culture.¹ At this point again, however, the transition was not sharp. Between the Early Palaeolithic and the Neolithic culture there were at least two intermediate types: the Late Palaeolithic and the Mesolithic; in the Americas the Old-World Mesolithic culture has a counterpart in the 'Archaic' culture;² and at this stage the pace of cultural change—measured in terms of the average time-span of a single human generation—was immensely slower than it was at the stage in which the Neolithic culture was turning, through the Chalcolithic, into civilization.³

Measured in terms of this standard unit of the generation, the pace of cultural change has, in fact, been accelerating—and this at an accelerating rate of acceleration—since the earliest stage of human history so far known to us from disinterred relics of Man and his artefacts. In our generation the rate of acceleration has been keyed up to an unprecedented pitch; and we are having to face the questions whether there may not be a limit to the amount of cultural change to which human nature can adapt itself within a single lifetime, and whether we may not be approaching this limit or perhaps exceeding it.

In the past the impact of cultural change has been softened by a persistent survival of the old, side by side with the new. Each successive new type of culture has been embraced whole-heartedly and thoroughly by no more than a minority, and, even within this minority, ancient cultural habits have held their own. Hunting, for instance, which was one of Palaeolithic Man's two staple ways of winning his livelihood, has survived into the age of civilization as a highly appreciated form of 'sport'; and in the form of fishing, which has proved to be its most efficient and least rapidly exhaustible form, hunting has remained a staple part of Man's economy. Even now we are only just beginning to replace hunting in the sea by the method of deliberate cultivation that we have been following on the land since the Old-World Neolithic and the American 'Formative' age.⁴

In more general terms it may be said, with truth, that, although all but a tiny fraction of mankind is to be found today within the ambit of one or other of the living civilizations, the so-called 'dead' civilizations still survive in the legacies that they have bequeathed to the living civilizations and in the 'renaissances' that they have evoked in the

¹ A. R. Burn points out that 'there is no case on record of what we may perhaps call truly primitive societies, that is pure "food-gatherers"', being successfully brought within the orbit of a civilization, whereas so-called primitive peoples who have passed through the agricultural revolution often have so been. Food-gatherers find the strain of such forcible integration into an alien society too great, and die out, like the West Indian islanders and most of the North American Indians; while African slaves are successfully—from the invaders' point of view—introduced to replace them' (*History*, February–October, 1956, pp. 7–8). Burn cites other pertinent examples.

² According to Willey's and Phillips', as opposed to Spinden's, usage of the term 'Archaic' (see pp. 340–3).

³ See further Chapter IX, pp. 327–43.

⁴ Examples of this substitution of cultivation for hunting are the institution of hatcheries for fish, the laying-down of oyster-beds, and, in Japan, the cultivation of both oysters and edible seaweed on the grand scale on rafts moored in the sea in sheltered inlets. This Japanese pioneering enterprise in cultivating the sea may perhaps foreshadow what may become Man's main source of food if the planet's total human population ever reaches the numbers that have been forecast.

histories of these.¹ More than that, the Neolithic culture of the Old World and the 'Formative' culture of the Americas still survive in the living civilizations or—it might be more accurate to say—under their surface.² Something between two-thirds and three-quarters of the living generation of mankind is accounted for by a peasantry that is still in the Neolithic state of mind and is virtually still leading the Neolithic way of life,³ notwithstanding the fact that they have long since learnt to use some of the metal tools and other pieces of Post-Neolithic equipment that have been invented in the nurseries of civilization within the last five or six thousand years.⁴ Again, it may be said, with truth, that, though all but a tiny fraction of the living generation of mankind is to be found today within the ambit of one or other of the higher religions, even the minority that is not still living virtually in the Neolithic or 'Formative' age is virtually still living in the age of civilization as it was before the higher religions made their appearance. The higher religions have suffered many backslidings in their attempts to shake themselves free from the lower religions out of which they have sprung, and, in relapsing to this lower level, they have relapsed into being integral parts of societies that are not exclusively, or even primarily, of a religious nature.⁵ The effect produced on the majority of mankind by the higher religions, during the two and a half millennia of their existence up to date, has perhaps been still slighter than the effect of the civilizations during their five millennia.⁶

All the same, the influence of the civilizations and the higher religions has made up to some extent for its superficiality up to date by the speed and range of its diffusion. This point is illustrated by the very widespread present use of metal tools among a peasantry that is otherwise still Neolithic. Since a very early stage in the successive rises of civilization and higher religion, each of these two ways of life has made an impact on all surviving earlier ways, and has influenced all of them in some degree, without yet having completely put any of them out of

¹ P. A. Sorokin makes the point that many elements of civilizations that are customarily written off as being dead are, in truth, alive today (*Toynbee and History*, p. 184).

² This point is discussed further in the Annex to Chapter II, pp. 602-4. It is made in general terms by R. Coulborn in *Phylon*, 1940, offprint, p. 53. In the particular case of the Maya province of the Middle American Civilization it is debated by S. F. de Borhegyi in *American Antiquity*, vol. xxi, No. 4 (1956), pp. 343-56, and by G. R. Willey in *The American Anthropologist*, vol. 58, No. 5 (October, 1956), pp. 777-82.

³ This point is made by C. S. Coon in *The History of Man*, p. 151.

⁴ L. Mumford criticizes me for ignoring the primitive elements that survive in the living civilizations (*Diogenes*, No. 13 (Spring, 1956), p. 14).

⁵ See pp. 85-97. There is this much justification in R. Coulborn's charge that I have drawn too sharp a line between 'higher religions' and others (*Toynbee and History*, pp. 155-6). It is true that in religion, as in everything else, the distinctions drawn by human minds are necessities of the process of thinking which misrepresent, to some extent, the Reality that we are trying to apprehend. In reality there are gradations and interpenetrations, not sharp dividing lines or clean cuts. All the same, the epiphany of the higher religions is, I should say, the most outstanding event in recorded human history up to date; and, if I am right in holding this controversial opinion, then the distinction that I have drawn between 'higher' and 'lower' religions will be a closer approximation to Reality than a view of religion in which different levels or species of it are not distinguished.

⁶ Chr. Dawson justifiably questions a suggestion of mine that the rise of the higher religions might lead to the civilizations withering away (*Toynbee and History*, p. 133). R. L. Shinn asks whether a church can really take the place of the civilizations (*Christianity and the Problem of History*, p. 233).

action. Human culture is, in fact, now stratified, like the surface of the planet on which it subsists, in a heap of layers that still remain distinct enough from each other to provide a decipherable record of a series of passages of history. It has still to be seen whether our current 'post-modern' civilization, with its unprecedented penetrative power, will be able to perform the unprecedented feat of fusing all the diverse strata of society into a single homogeneous social magma with the consistency, and perhaps the savour, of processed cheese. Meanwhile, it is evident that the different strata of culture have not only been more numerous than I have allowed for, but have also been less sharply divided. They have coexisted with each other, and there has already been much mutual interpenetration. My over-simplified antithesis between just one age of primitive culture and just one succeeding age of civilization has to be corrected accordingly.

I have also been criticized for having exaggerated the sharpness of the demarcation between one civilization or higher religion and another. Here, I think, it is my critics who are in error. They have mistaken an operational procedure of mine for a definitive account of my view of Reality, and they have fallen into this error in spite of my having, in this case, certainly made it clear what I was doing. In introducing my notion of a civilization as being 'an intelligible field of study', and in illustrating this idea by taking the Hellenic example of a civilization as my working 'model', I took note, at the very beginning of this book, of the relativity of the separateness, in reality, of any unit that one might pick out. I noted, for instance, at this early stage, that the Hellenic and the Western civilizations were related to each other by a link which I labelled 'apparentation-and-affiliation'. I noted that the Christian Church had played something like the role of a chrysalis in the transition from the disintegration of the Hellenic Society to the genesis of the Western. I noted that Christianity itself had arisen out of an encounter between two civilizations, the Hellenic and the Syriac. I noted that, in modern times, the Western Civilization had had encounters with almost every other living civilization and pre-civilizational culture. I gave a plan of the whole book in which I showed that I did not intend to confine myself to a comparative study of civilizations in which I should be treating these, provisionally, not only as if they were so many specimens of their species, but also as if each specimen were entirely self-contained and therefore entirely intelligible if studied by itself. I announced my intention of going on to study the contacts between civilizations—both those between contemporaries and those between non-contemporaries that are commonly described as being renaissances of a 'dead' civilization in the course of the history of a living one. And I did eventually carry out this intention in volumes viii and ix. It is true that some of the charges against me, on the ground that I had treated civilizations as closed systems, were made in reviews of the first two batches of volumes. But in each batch the plan of the whole book was printed and displayed conspicuously, and this ought, I think, to have led the critics to suspend judgement on this point, pending the publication of the promised discussion of 'contacts'. On this point, therefore, I feel no conviction of sin.

I have also been criticized—in this case, rightly, I think—for having painted in too strong colours the contrast between the state of a civilization in its growth stage and its state after it has broken down, if it happens to be one of the civilizations that have come to grief. E. I. Watkin¹ and C. Trinkaus² contend that I distinguish these two stages from each other too sharply, and P. A. Sorokin³ that my ‘uniformities of growth and decline . . . are largely fantastic and are not borne out by the facts’. A. R. Burn contends⁴ that ‘there is no real distinction between’ my “growing” and “broken-down” civilizations in point of brutality or “radiation by charm”. He illustrates this contention from Hellenic history.

“The seventh and sixth centuries, the period of the most rapid growth of Greek culture, are known in political history as the “Age of the Tyrants”: a period of violent, often bloody, and at times atrocious class-conflict and revolution, affecting precisely those cities which took the most active part in the transformation of Greek society, and in the efflorescence of a new art.”⁵

Richard Pares, too, contends⁶ that periods of growth are not, in fact, periods of harmony; and other critics have made the same point with regard to particular features in my picture.

W. Altree observes,⁷ with regard to Sinic history, that the spirit of the Sinic Civilization was militaristic and aggressive throughout the Shang and Chou periods, and that the intensification of warfare in and after the seventh century B.C. was due, not to any spiritual change from bad to worse, but to an increase in the means of making war and in the prizes to be won by it (the introduction of iron tools, draft animals, irrigation, and manure strengthened the economic sinews of war by increasing productivity and so providing a larger surplus, beyond the requirements of bare subsistence, for expenditure on war, while the growth of cities created a market economy which, in its turn, accumulated stores of grain large enough to be worth raiding). M. Watnick contends⁸ that creative and uncreative minorities are not confined respectively to periods of social growth and periods of social disintegration in the senses in which I use these terms. J. K. Feibleman remarks⁹ that the social maladies, and the attempted remedies for them, that I depict, are not confined to periods of social disintegration. O. Handlin makes the same point, with regard, in particular, to archaism and futurism.¹⁰ A. H. Hanson makes the point that disturbances, unrest, and revolutions are normal elements in the process of history at all times.¹¹ P. A. Sorokin,¹² R. H. S. Crossman,¹³ and A. R. Burn¹⁴ point out

that barbarians have not been assimilated peacefully by expanding civilizations when these were in their growth-stage—for instance, not by the Hellenic Civilization before 431 B.C. Barbarians have always resisted attempts to subjugate or expropriate them, in whatever state the aggressive civilization may happen to have found itself at the time. This is true, and Burn is right in saying¹ that

'the hostility of the barbarian west towards Greek expansion, even while it continues to import and to be stimulated by Greek works of art, culminates in the "barbarian reaction" of the sixth century, in which members of every unconquered people with which the Greeks were in contact take part, as allies or hired warriors, in the concerted efforts of Carthage and the Etruscans to halt the Greek colonists . . . and to expel them.'

Burn here puts his finger on a distinction that I have missed, though it is essential for a proper presentation of the point that I have been trying to make about the difference in the attitude of the barbarians towards a neighbour civilization in different phases of this civilization's history. The point is that people feel and act differently on the cultural and on the political plane. The common experience of sharing, or appreciating, the same culture does not deter different political communities from fighting each other, and, conversely, fighting each other does not deter them from sharing, or appreciating, the same culture. Englishmen who were fighting Germans in the First and the Second World War did not lose their love of German music or cease to think of it as being *their* music; and Germans who were fighting Englishmen in the same wars did not lose their love of Shakespeare's plays or cease to think of these as being *theirs*. Similarly, the barbarians who resisted Greek aggression by force of arms in the 'growth-stage' of the Hellenic Civilization continued, as Burn testifies, to feel the attraction of the civilization and therefore went on Hellenizing themselves voluntarily. On the eve of Hellenism's fifth-century catastrophe, Ducetius, the Sicel patriot who had led his Sicilian fellow barbarians' last forlorn hope in their struggle to throw off the yoke of the aggressive colonial Greek city-state Syracuse, went into exile at Corinth, Syracuse's mother city in Continental Greece, and eventually returned to Sicily in order to found in his own country a city-state on the Hellenic pattern.

Other barbarians fought the Hellenes, as Ducetius fought them, from beginning to end of the long history of the Hellenic World's relations with its barbarian neighbours; but the Hellenic Civilization did not captivate all barbarian leaders of resistance movements in all chapters of the story, as, in the earlier chapters, it had captivated Ducetius and his predecessors. There came a time when barbarians became unwilling to receive the Hellenic Civilization without giving it a distinguishing twist of their own, or even unwilling to receive it at all. This change in the barbarians' attitude towards Hellenism is, I believe, a verifiable historical event, and an important one. I also believe that it was due, not to a change in the barbarians' own spirit, but to a change in the character of

¹ Ibid.

the Hellenic Civilization with which they were in contact. This change was, in fact, the change for the worse that I have sought to indicate in coining my terms 'growth' and 'disintegration'. On the level of feeling, the difference in the state of things before and after this change has been well put by D. B. Richardson.¹ Participants in a growing civilization feel, he notes, an 'exultation', based on their religious sense, which may be described as 'exaltation'. On the other hand, there is an absence of exultation among participants in a civilization that is in decline.

Besides being criticized for having drawn a distinction between 'growth-periods' and 'disintegration-periods', or at any rate for having painted the contrast between the two in excessively strong colours, I have been criticized for trying to determine too precisely the moment at which the change that I call the 'breakdown' of a civilization occurred. In general, Pieter Geyl, for example, finds the sharpness of my demarcations between different phases of history unconvincing.² In particular, I have been criticized—for example by H. Michell,³ P. A. Sorokin,⁴ W. den Boer,⁵ J. F. Leddy,⁶ M. S. Bates,⁷ D. M. Robinson,⁸ and A. R. Burn⁹—for having picked out the year 431 B.C. (the date of the outbreak of the Great Atheno-Peloponnesian War) as a moment at which the Hellenic Civilization brought upon itself a 'breakdown' from which it never succeeded in recovering. I have come across only one reviewer (J. Vogt)¹⁰ who has endorsed this date of mine, and he has endorsed it only after much hesitation.

Are 'epoch-making' events realities, or are they figments of the imagination? I do not know what has been the experience of other people, now alive, who were grown-up at the time of the outbreak of the First World War in August 1914. For me that moment has been 'epoch-making' ever since. My lifetime, viewed in retrospect, is still divided into a 'pre-1914' and a 'post-1914' period as sharply as the traditional Western scheme of chronology divides all history into 'B.C.' and 'A.D.' At the moment of the outbreak, in 1914, of a great and evidently fateful war in the society into which I happened to have been born, I felt myself suddenly understanding what (it seemed to me) Thucydides must have felt at the moment of the outbreak of war in his society in 431 B.C. Leddy suggests¹¹ that I have been too much impressed by 'Thucydides' point of view and that this is what has led me to make too much of the date 431 B.C.—as, in Leddy's opinion, I have done. Actually, it was my own experience in A.D. 1914 that made me appreciate what Thucydides had felt in 431 B.C., and made me endorse Thucydides' view of the importance of the great war whose history he resolved, there and then, to write. Whatever may be the verdict of posterity on the historical importance or unimportance of the year A.D. 1914 in Western

history, I remain convinced, on reconsideration, that the verdict of history has already justified—and this conclusively—Thucydides' judgement of the importance of what happened to the Hellenic Civilization in the year 431 B.C. Moreover, 431 B.C. and A.D. 1914 are far from being the only dates that have been singled out by contemporaries and by posterity as being 'epoch-making'. Alexander's passage of the Hellespont, the nativity of Jesus, the *hijrah* of Muhammad, the first landfall of Columbus in the Americas, and the landfall of the *Mayflower* are a few of the more celebrated cases in point.

The criticism of my practice of singling out a definite date to mark the 'epoch-making' event of the 'breakdown' of a civilization has also been put in more general terms. Richard Pares castigates¹ my 'habit of pinning a long and complicated process to one or two salient events in order to dramatise it'. A. H. Hanson also objects² to my treating long chains of events as being consequences of particular decisions taken by particular individuals at particular moments. It is, for instance, an inadmissible simplification, Hanson considers, to trace back to something done by Pope Gregory VII in the year 1075 the character of all subsequent Western history.

'If one is prepared [he sums up] to reduce the complexity and variety of history to such a single cause-and-effect stream, any important decision can be made into the "first cause" of a whole series of events, within the category to which it applies.'

In a similar vein Sir Ernest Barker asks³ whether the West can really have been on the wrong track, as I suggest that it may have been, since the time of the Emperor Frederick II Hohenstaufen. J. F. Leddy pronounces⁴ that it is fantastic to suppose that events in the time of the Roman Empire could have been determined by things that had happened hundreds of years earlier. E. Dyason comments⁵ that, when one is called upon to regard, as the cause of the 'breakdown' of civilization in Egypt, events that occurred 1,700 years before its final dissolution, it is difficult to give the weight which Toynbee gives to their evidence. Philip Bagby enunciates⁶ a general law of historical causation to the effect that a cause must be proximate as well as adequate, and, like Leddy, he finds in this a ground for questioning my view that what happened in the Hellenic World in 431 B.C. exercised a continuing effect on the whole subsequent course of Hellenic history.

Bagby's law would seem to be difficult either to validate or to apply because of the intrinsic relativity of the key word 'proximate'. Its meaning depends entirely on the chronological horizon that we happen to choose, and we have a choice between any number of alternatives: there is no criterion for deciding that any one of these is the proper horizon, and that the others are inadmissible. If we take for our horizon

the beginning of the Modern Age of Western history, then only those events will be proximate that have been remembered and recounted to us by our grandparents, and this will limit the maximum run of historical causation to something like one hundred years. If we take the rise of the earliest civilizations some five thousand years ago, then any event since the emergence of the Western Civilization, some twelve hundred years ago, will be proximate for Westerners of the present generation. If we think in terms of the estimated age of life on Earth, then any event in human history since the first appearance of *homo sapiens* will be proximate. If we think in terms of the age, up to date, of this galaxy, then any event in the history of this planet will be proximate in this astronomical context. Each of these usages of the word 'proximate' is as legitimate as every other, because each of them depends directly on a particular choice of the time-span that is to be taken as our standard of measurement; and the choice is arbitrary because it is completely free. If, for the particular purpose of studying human affairs, we decide to choose for our standard one of the shorter time-spans—say, the age-of-civilization span or the age-of-mankind span—we shall get more closely to grips with Reality if we drop the inconclusive word 'proximate' and think of the time-factor in human relations in terms of an indefinite number of different definite time-scales, each governing some particular kind of relation at some particular level.

'In a civilization there are definite time-lags involved in the communication of knowledge and emotions between the thousands or millions of individual persons belonging to the commonwealth. . . . There are dialectics of ideas or concepts that unravel themselves in years, decades, and centuries. All these various time-lags are rather independent of the reason and the free will of Man.'¹

The Buddha's concepts and precepts, for example, are still actively communicating themselves to millions of His fellow human beings today, two and a half millennia after the date of His Enlightenment. What is more, the influence of every one of the forgotten human beings who have ever lived is still affecting everyone in the living generation to some infinitesimal degree.

2. THE UNAVOIDABLENESS OF COMPARATIVE STUDY BY MEANS OF MODELS

However, the problem of the nature and range of historical causation (if causation is the right word here) is not, I believe, the main question at issue between my critics and me in our debate about whether it is legitimate to draw sharp lines and to lay on strong colours when one is attempting to give a panoramic exposition of human affairs. The main question is whether one is justified in attributing to particular events a significance for the understanding of the course of events as a whole. Pares suggests, in a passage quoted above, that I pick my particular events out because they are 'salient', and that I do this in order to

¹ D. B. Richardson in *The Thomist*, vol. xx, No. 2 (April, 1957), p. 183.

'dramatise' a long and complicated process. I myself would maintain that I pick them out, not because they are salient, but because they seem to me to be illuminating, and that my objective, when I use this device, is explanation, not dramatization. My 'key' events, dates, periods, plots, and processes serve me as symbols: that is, as landmarks which, like a pioneer's blazes on tree-trunks, have a meaning that points to objects beyond themselves. These objects may be distant; a single blaze may guide a traveller who takes note of it to some spring, ford, pass, or shelter many days' march away. The token does not, of course, exhaust the meaning of the thing betokened by it; but, if it is well chosen, it will work as a key to turn a lock and thereby open a door.

An example of this intellectual operation is my use of the three-masted square-rigged sailing-ship as a symbol of the Western Civilization in its modern age (*circa* A.D. 1475-1875). John Strachey¹ has objected that the invention of this new type of ship in the West in the fifteenth century is only one among the factors which account for the West's acquisition, in this age, of an ascendancy over the rest of the World. He points out that the relation between these many various factors was intricate, and that to ascribe the whole result to the invention of the 'ship' would be to give a misleadingly simplified account of a process that was really very complicated. I should have been guilty of this error if I had sought to present the 'ship' as being the sole and whole cause of the West's rise, in the modern age, to a position of world-wide hegemony. My intention, however, was not that. For me the 'ship' is not so much a cause as a symbol—the most illuminating one within my knowledge—of the new spirit which made the West's modern triumphal progress possible.

Of course, this new spirit also manifested itself in a thousand other outward and visible signs, and some of these, too, could be used, and have been used, as symbols of it. It is in the nature of a symbol that it has no monopoly. It has none because it is not identical or coextensive with the object that it symbolizes. If it were this, it would be, not a symbol of the thing, but the thing itself. A critic is falling into an error if he supposes that a symbol is intended to be a reproduction of the thing that it is really intended, not to reproduce, but to illuminate. His shafts fly wide of the mark if they are launched under this misapprehension. The test by which a symbol stands or falls is not whether it does or does not faithfully reproduce the object to which it points; the test is whether it throws light on that object or obscures our understanding of it. The effective symbol is the illuminating one, and effective symbols are an indispensable part of our intellectual apparatus. This is the meaning of the at first sight paradoxical dictum that, in order to grasp the real context, we have to construct an unreal one.² Of course, the constructor of a symbol does not introduce unreality into it out of perversity. In so far as a symbol does depart from Reality, it falls into danger of defeating its constructor's purpose by becoming misleading. In my attempts to construct symbols in this book, I am sure to have made errors of this

¹ In unpublished correspondence.

² Max Weber, cited by J. Romein in *Toynbee and History*, p. 347.

kind. Some of these have, in fact, been pointed out by my critics. Having to make a symbol unreal at the risk of making it misleading is one of the awkward necessities of thought. It is necessary because, if a symbol is not simplified and sharpened to a degree that reduces it to something like a sketch-map of the piece of Reality on which it is modelled, it will not work as an instrument for intellectual action.

When a symbol is used as an instrument it becomes a 'model', in the sense in which this word has come to be used apropos of scientific investigation.

'Men think in terms of models. We may think of our thought as consisting of symbols which are put in relations or sequences according to operating rules. Together, a set of symbols and a set of rules may constitute what we call a calculus, a logic, a game, or a model. It will have some structure, i.e. some pattern of distribution of relative discontinuities, and some "laws" of operation.'¹

Whether a model resembles anything in the outside world can be discovered only by verification.² When we verify a model by testing how far it does or does not correspond to the phenomena, this is, of course, not an end in itself but only a means to an end. Our ulterior purpose is not to learn whether the model is or is not valid; it is to get new insight into the structure and nature of Reality by applying a model that is valid and is therefore an effective tool. How far the model is or is not valid is not a matter of any intrinsic interest in itself. As Bagby puts it,³

'It seems best to look on models as a heuristic device rather than as the goal of our studies. In so far as the models appear to be valid, we might look on them, not indeed as a description of the events, but as a description of the interrelationships of certain factors present in the events. A full understanding of the events would involve the elucidation of all the other factors present, factors which we may not be able to identify.'

In this context Bagby suggests that it might be useful to set up a model for the development of a major civilization. This is what I have done in previous volumes of this book, though I have done it without being altogether conscious of what I have been doing, and indeed without knowing, until recently, the current term of art for this intellectual operation. I have constructed my model from the pattern of Hellenic history and the pattern of its relations with the histories of Christianity and of the Western Civilization, as these patterns present themselves to me. The extensiveness of my use of this model has been noted by a number of my critics.⁴ A majority of them, in noting this, have pro-

nounced that I have worked this model to death or have made of it a bed of Procrustes into which I have fitted the histories of other civilizations by doing violence to them.¹ These criticisms would have led me to reconsider my use of this model, even if I had not felt myself moved to do so spontaneously. I am going to do this in the present chapter; but first I must explain why I believe that a model, or a set of models, is an indispensable instrument for anyone who is trying to organize a comprehensive study of human affairs.²

In setting out on this large enterprise the explorer can find guidance for the first stage of his course in a pair of instructions. He must recognize the truths that, since he is a human being, his standpoint will be a relative one and his attitude a self-centred one, and he must take account of these two truths in his policy for action. He must accept the limitations of relativity by starting operations, consciously and deliberately, from his own time and place. He must reject the limitations of self-centredness by seeing to it that he does not end up at the point from which he has started. One's own time and place are clearly not the culmination of all history.

I have tried to follow this pair of instructions in my own work. I am a Westerner born in A.D. 1889, so I took as my starting-point the recent Western practice of making all human history culminate in the Western inquirer's own country in his own time. If I had been an Englishman of an earlier generation—a contemporary of the Venerable Bede's or even

modsen and G. C. Wasberg in *Samtiden*, vol. 58, hefte 12 (Oslo 1949), pp. 647-60; H. Frankfort in *The Birth of Civilization in the Near East*, pp. 21-22 and 26-27; W. H. McNeill in *The Intent of Toynbee's History: A Cooperative Appraisal*; the Rev. E. R. Hardy Jr., *ibid.*

As Erdmann puts it, 'the Hellenic Civilization is', in my vision, 'not an exemplar, but an archetype. . . . It might be still truer to Toynbee's intent to say that, running through Hellenic history, the completed archetypal career of a civilization becomes visible, and that this civilization serves as a transparent medium through which the phenomenon of civilization itself can be apprehended in its archetypal form (*Die Antike . . . ist, nicht Vorbild, sondern Urbild. Oder vielleicht wird man der Absicht Toynbees noch gerechter, wenn man sagt, dass durch sie hindurch ein urbildlicher Kulturablauf abgeschlossen sichtbar werde, dass sie transparent sei für das Urphänomen der Kultur*).'

¹ For instance: Sir Ernest Barker finds that my analogies with Hellenic history are sometimes fanciful (*Toynbee and History*, p. 92). Chr. Hill finds that I devote 'enormous ingenuity to the task of discovering other "societies" which will fit into' my 'plan, and to working out parallels between them and' my 'norm' (*The Modern Quarterly*, Autumn, 1947, p. 292). W. den Boer finds that I force other civilizations into the framework of the Hellenic Civilization by Procrustean methods (*ibid.*, p. 226). H. E. Barnes finds that my use of the Hellenic model constrains me frequently 'to squeeze' my 'facts into a pattern and framework which they do not always fit' (*An Introduction to the History of Sociology*, p. 721). The same judgement is passed by J. K. Feibleman (*T'ien Hsia Monthly*, vol. xi, Nos. 1 and 2 (1940), p. 20); A. Hourani (*The Dublin Review*, vol. 229, No. 470 (December 1955), p. 381); W. Gurian (*The Review of Politics*, vol. 4, No. 4 (October, 1942), p. 512); T. J. G. Locher (*De Gids*, May 1948, offprint, pp. 6-8); K. D. Erdmann (*loc. cit.*, pp. 224-5), with particular reference to my use of the Roman Empire as a model for universal states; F. Hampl (*the Historische Zeitschrift*, Band 173, Heft 3 (1952), p. 458); R. K. Merton (*The American Journal of Sociology*, vol. xlvii, No. 2 (September, 1941), pp. 205-13); Hajo Holborn (*The Saturday Review of Literature*, 31st May, 1947), with particular reference to my use of the Roman Empire; J. A. Tormodsen and G. C. Wasberg (*Samtiden*, vol. 58, hefte 12 (Oslo 1949), pp. 647-60); J. Bishko (*The Richmond News Leader*, 21st October, 1954); H. Frankfort (*The Birth of Civilization in the Near East*, pp. 24, 30-31, 99).

E. Fieser declares that my Hellenic paradigm 'persuades as it pervades'. But Fieser is in a minority.

² Vico, for instance, found a model in the history of Italy, as Engel-Janosi points out in *The Intent of Toynbee's History: A Cooperative Appraisal*.

of Saint Thomas More's—I should, no doubt, have made history culminate, not in England, but in Western Christendom; for, at any date from the conversion of the English to Christianity down to the Reformation, the consciousness of being an adherent of the Western Christian Church would have overshadowed the consciousness of being a subject of the English Crown in the thoughts and feelings of an inhabitant of the Kingdom of England—or, rather, of one or other of the Roman Patriarchate's two arch-dioceses of Canterbury and York. The priority of ecclesiastical over political allegiance was symbolized locally in the shrine of the martyr Saint Thomas Becket, until King Henry VIII plundered and desecrated this shrine and sent another Saint Thomas to his death. If I had happened to live in an age in which the Western Christian Church, not the Kingdom of England, would have been my natural starting-point, I should have had a different experience in the later course of my explorations.¹ I should not have been pulled up short, and compelled to change my plan of operations, by finding, as I did find, that the higher religions could not be dealt with adequately within the framework of a comparative study of civilizations. On the other hand, I might then have found that the framework of a comparative study of higher religions, which I should have adopted if I had been doing my work in the eighth century or in the early decades of the sixteenth, was not entirely adequate for dealing with the civilizations, not to speak of the pre-civilizational societies.

However, I happened to be born in 1889, so, for me, there was no question of taking my ancestral religion as my starting-point. As a matter of course I took my native country. I then duly rejected the self-regarding hallucination of mistaking the England of my time for the culmination of history. I found that England, taken by itself, was not, in fact, an 'intelligible field of study' either in my time or at any earlier date since the time when such a thing as England had first become discernible on the political map. I therefore went in search of the minimum unit, of which England is a part, that might be found intelligible if treated as being self-contained, and I found this in the Western Civilization. Having thus identified my native specimen of a species of society that not only was larger than a nation-state but also was more intelligible, in virtue of approaching nearer to being self-contained, I became aware of the presence of the other living civilizations with which the West was in contact in my day. Between them, they and the West account for all but a fraction of the whole living generation of mankind. But, for the purpose of a comprehensive study of human affairs, the civilizations in this set have a common property which greatly detracts from their usefulness. Just because they are still alive, their histories are not yet finished; and at least one complete specimen of the history of a civilization is a necessary first piece of material evidence for a study of the species.

I therefore probed backwards in time, towards the origins of my own native Western Civilization, till I struck the latter end of an earlier one, the Hellenic, to which the Western Civilization is affiliated through

¹ This point is taken up again on p. 218.

the Christian Church. The history of this Hellenic Civilization was a complete specimen of its kind. It had certainly come to an end, for in my day there was no longer any Hellenic Civilization in existence. It had long ago been superseded by two successors: the Western Civilization and the West's sister and contemporary, the Byzantine Civilization. The history of the Hellenic Civilization also certainly did not extend backwards in time beyond our ken, for it was known to have had, not only successors, but also a predecessor, the Minoan-Helladic-Mycenaean Civilization. Here, then, in the history of the Hellenic Civilization, was the specimen history of a civilization for which I was looking. It had one general merit and two special merits for a Western inquirer. Its general merit was its completeness. It had an identifiable beginning and end, and the whole story, in between, was on record, at least in outline. Its special merits for a Western inquirer were its link with Western history and its familiarity to a Westerner. Even if he had not been educated in the Greek and Latin classics, he would be likely to know more about Hellenic history than about the history of any other civilization outside his own.

Now that I had found my complete specimen of the history of a civilization, how was I to use it for my purpose? This purpose was to explore ways and means of organizing a comprehensive study of human affairs; and, from the start of my inquiry, I had rejected the customary presentation of history that leads the whole of it up to the inquirer's own time and place. This means rejecting a single-track chart of history; for it is only by making it all lead up to oneself that one can persuade oneself that history runs along a single line. From any non-self-centred standpoint it will be evident that history must run simultaneously along two separate lines as a minimum. Two is the minimum for the history of living beings of any species in which the mode of reproduction is the sexual one; and any such species that was actually represented by no more than one specimen of each sex would be, of course, on the verge of extinction. In order to have a reasonable prospect of survival, a species must have dozens of representatives or millions; and, whatever may be the species that we are studying, the number of representatives of it with which we shall have to reckon is sure to be of the plural order of magnitude, not the dual or the singular. In fact, a single-track chart of the history of anything whatsoever will be a false picture of Reality: a picture of it in which the truth has been distorted by the observer's uncorrected egocentricity. A multiple-track chart is the true picture of the movement of the phenomenal universe or of any part of it. This finding applies, of course, to the study of the histories of civilizations and of higher religions. It is impossible to force all the known specimens into a configuration that makes them all culminate in some single point-moment.

If we try, for instance, to make the histories of all the known civilizations lead up to the West in our time, we shall not be able to find any place for the Byzantine and Islamic civilizations at any date before the West impinged on them in the Crusades, or for the civilizations in India, Eastern Asia, and the Americas at any date before the landfalls of

Western ships on their coasts in and after the last decade of the fifteenth century. Alternatively, if we try to make them all lead up to China in our time, we shall not be able to find any place for the Indian, Islamic, Byzantine, Western, or pre-Columbian American civilizations. A single-track chart of history leading up to present-day China will be able to take account of Indian history only since the first century of the Christian Era, when Buddhism made its first lodgement on Chinese soil. It will be able to take account of Islamic history only since the thirteenth century, when Islam gained a foothold in north-western and south-western China in the wake of the Mongol conquest. It will be able to take account of Western history only since the sixteenth century, when the first Portuguese ships reached Chinese ports. Moreover, in so far as any of the alternative possible single-track charts does have to take account, however fragmentarily, of the parallel histories of contemporary civilizations, it is confessing its own invalidity; for it is admitting the existence of civilizations whose histories cannot be accommodated on its own single track.

Corresponding difficulties would arise from the use of a single-track chart if we were taking the histories of the higher religions as our units of study. For example, the traditional Christian chart of mankind's religious history makes the whole of it lead up to Christianity via Judaism from Abraham and via Abraham from Adam. But this Christian chart is, of course, unacceptable to the adherents of all the other higher religions. It is unacceptable to Muslims because their chart makes the whole lead up from Adam via Abraham to 'the pure religion of Abraham': that is to say, Islam. It is unacceptable to Jews because, for them, the single track reaches its divinely appointed terminus in themselves, and they reject, as preposterous, the Muslims' and the Christians' rival claims to have superseded the Jews in the role of being God's 'Chosen People'. Finally, the Christian chart is unacceptable to Zoroastrians, Hindus, Buddhists, Taoists, and Confucians because it completely ignores their existence. But, if we were to try to appease feelings wounded by the Christian chart by substituting the Confucian or the Buddhist chart for it, we should run into the same trouble in reverse. We should be wounding the feelings of the adherents of all three religions of the Judaic family. In short, whether the units in terms of which we are thinking are higher religions or civilizations or entities of any other kind, single-track charts of history will not work. Multiple-track charts are the only kind that will fit the phenomena as we find them.

In a mental picture, fitting the phenomena is a supreme merit. It tells decisively in favour of multiple-track charts as against single-track charts. But the price of the intellectual gain won by rising from the singular to the plural is the consequent presentation of an intellectual problem that a single-track chart does not raise: the problem of organizing the data.

So long as one is following a single track, no problem of organization arises. The observer has merely to take events as he finds them; he finds them in a sequence; and a sequence can be reproduced in a narrative. But, as soon as he refuses to keep to a single track any longer, the

observer finds himself with a number of simultaneous phenomena on his hands. These cannot be dealt with in a single narrative, because they do not constitute a single sequence. A number of different narratives have now to be brought into some kind of relation with each other, and *ex hypothesi* this relation cannot be the narrational one, since it is not possible to be telling more than one story at a time. When we have to establish a relation between two or more series of concurrent events, this requires us to take a synoptic view of them, and that, in turn, requires us to study them comparatively. For example,

'The situations in from 13 to 48 states cannot be adequately described in a unified narrative; to have meaning, they need to be seen in an analytical structure.'¹

And we can have a history of particular monarchies or a sociology of monarchy, but not a history of monarchy.² The history of European literature, too, can be studied only analytically—that is, comparatively.³ In more general terms,

'An approach that uses the concepts of structure and process leads us to ask questions that cannot be answered merely by identifying the succession of events. Events are of the moment, episodic; process and structure have duration in time, recognisable patterns, and a high degree of continuity.'⁴

A comparative study of a number of specimens means noting their likenesses and differences with a view to discovering whether or not there is a standard type to which they conform, notwithstanding their individual peculiarities. But in order to make our comparison with any assurance we have also to satisfy ourselves that the specimens which we are proposing to compare are properly comparable.⁵ Here are two intellectual operations that are required of us as soon as we adopt a multiple-track chart of the phenomena in place of the self-regarding and misleading single-track one; and this is where the construction of a model can, I believe, serve us in good stead. My own use of my Hellenic model has been criticized by Erich Voegelin⁶ in the following terms:

'The construction of type-concepts, which should be based on the civilizational courses, slides over, in the practice of the operation, into the entirely different task of identifying societies as members of the species through the application of the type-concepts, developed from the limited basis, to data which are assumed to be fragments of civilizational courses of the same type.'

I do not dispute Voegelin's account of what I have done, but I do dispute the suggestion—if I am right in detecting this—that what I have

⁵ This obvious but fundamental point is made by H. E. Barnes in *An Introduction to the History of Sociology*, p. 732.

⁶ In *The Intent of Toynbee's History: A Cooperative Appraisal*.

done is not intellectually legitimate. What Voegelin is describing is, I should say, the normal heuristic use of an hypothesis, and, if this is the use that I have made of my Hellenic model, as I believe it is, then I do not think that my practice needs reconsideration or revision.

It is true that the operation of constructing a model is different from the operation of testing whether it fits the phenomena.¹ But, so far from its being proper to dissociate the two operations from each other, it would seem to be impossible to obtain sure results from either of them if they are not carried out in conjunction. The model has to be constructed out of only a fraction of the total body of data, or we should never be able to mount it for use in investigating the remainder. But, just on this account, the structure will remain tentative and provisional until it has been tested by application to all the rest of the data within our knowledge.² Conversely, our picture of the data as a whole will remain chaotic until we have found a model that brings out in them a pattern of specimens of a species. Unless we bring these two operations into conjunction with each other by conducting them simultaneously and interdependently, we cannot tell whether or not our provisional model provides a genuine clue to some principle of order in the apparent chaos, or whether this particular model must be modified or supplemented or discarded in favour of another. Nor can we tell whether the items in a particular conglomeration of data that we have picked out of the chaos, like a child picking spillikins out of a heap, have any significant common features, or whether they merely happen to have hung together accidentally. In performing each of the two operations, we have provisionally to anticipate the results of the other operation. The untested results of each provide a test—and this the only test at our disposal—of the other operation's validity. This reciprocal checking and counter-checking of unchecked assumptions may or may not be a form of arguing in a circle; but, even if it can properly be convicted of being that, it is useless to condemn the procedure on that account, because it is impossible to renounce it without renouncing the whole activity of thinking.

There is nothing unfamiliar about this mental procedure. It is the analytical and classificatory procedure which, as has been noted at the beginning of this volume, is the human mind's fundamental mode of operation and is consciously and deliberately followed in scientific inquiry,³ including the scientific study of human affairs. This is, indeed, the only way in which our minds can work either in the scientific field or in the practical one, since in all fields we have to cope with simultaneous phenomena in large quantities. This problem of dealing with large quantities besets the student of human affairs when he is approaching them as an historian no less than when he is approaching them as a

¹ G. Buchdahl, in *The Australasian Journal of Philosophy*, vol. 34, No. 3 (December, 1956), p. 168, quotes a dictum of Newton's about Newton's own method of work: 'In this philosophy, propositions are deduced from phenomena and afterwards made general by induction.' Buchdahl labels Newton's first step 'the inductive process' and the second step 'the inductive inference'.

² I hold (see pp. 41-45 and 244-6), as Bagby holds, that 'we shall only be able to judge our scheme when we have applied it to the actual facts of history and seen what results it gives us' (*Culture and History*, p. 202).

³ See pp. 9-13.

sociologist or a psychologist. Why, then, do some historians feel a repugnance, which psychologists and sociologists do not share, to applying the analytical and classificatory procedure to human affairs? The reason for this repugnance is apparent if Kroeber is right, as I believe he is, in holding¹ that the essence of the historian's approach is a concern to preserve the integrity of events, in all their individual complexity, in his way of presenting and explaining them. In any case the repugnance is both unquestionable and characteristic. It is illustrated, for example, by a comment of Sir Ernest Barker's on my work.

'With the passion of unity there naturally goes a zest for schematization: a zest for seeing history and the whole past in abstract general terms: a zest, if the phrase may be used, for "botanising" history²—for classifying in *genera* and *species* all its multitudinous data. I am inclined to call this zest by the name of "Linnaeanism". Dr Toynbee imposes patterns on history, and gives the patterns names, much as Linnaeus classified and named plants. But this raises the question whether history is really like botany.'³

Barker's answer to this question is, like Hourani's,⁴ in the negative, and he gives his reason. 'Plants have a general uniformity'; history 'is infinitely multiform'. This distinction is surely disputable. The truth surely is that all phenomena—plants, human affairs, or whatever they may be—are both multiform in some respects and uniform in others as they present themselves to human minds, and that this is the problem of knowledge and understanding with which the mind always has to cope, no matter what may be the nature of the phenomena with which it happens to be dealing in any particular case. If this is correct, the crucial question is whether history is really unlike botany in respect of the epistemological problem with which the inquirer's mind has to wrestle, and the right answer to this question is in the negative in my belief.⁵ In the paper here quoted, Barker lets this question go by default. After denying the legitimacy of applying the method of science to human affairs, he does not go on to make any suggestion for an alternative method to which a student of human affairs can resort when—as, in practice, is always the case—the quantity of simultaneous phenomena exceeds the capacity of a single narrative to carry the freight. It is just because the data of history are 'multitudinous' (to quote Barker's own word) that a resort to the method of classification, in addition to the method of narration, is, as I see it, unavoidable. If the inquirer is unwilling to resort to it, his only alternative is to accept defeat and to

¹ See the passages quoted on pp. 14 and 20.

² Cp. C. A. Beard in *The American Historical Review*, vol. xl, No. 2 (January, 1935), pp. 307-9; also F. S. Marvin in *The Hibbert Journal*, July, 1935, p. 623: 'The general plan of the work, as far as it is revealed in these first three volumes, is to collect, classify, and compare all the main types of civilization which his travel and study have brought to light; and then, as the result of this classification and comparison, to draw what conclusions are possible as to the laws of growth, spread, mixture, decay, and disappearance of the various species—treating, in fact, each separated and classified civilization much as a botanist or zoologist treats a species of animal or plant.'

³ Sir Ernest Barker in *Toynbee and History*, p. 95.

⁴ See p. 12.

⁵ I am not alone in holding this belief. W. F. Albright, for instance, likewise holds that 'there is . . . no basic epistemological difference between *comparable* fields of history and of science' (*From the Stone Age to Christianity*, 2nd ed., p. 115).

renounce all attempt even to present the phenomena, not to speak of trying to give some explanation of them.

This is not, of course, to say that the comparative study of human affairs is as plain sailing as the comparative study of flora or even fauna.¹ While it is not evident that human affairs are 'multiform' in some sense in which plants are not, it seems indisputable that they are more intricate than plants are; and, the greater the intricacy of the phenomena, the more difficult the quest for a model becomes. E. Voegelin observes² that adequate descriptive type-concepts are more difficult to arrive at for civilizations than they are for botanical specimens; and M. R. Cohen warns the inquirer³ that the 'single repeatable patterns of physics or physical laws have not been discovered in human affairs'. Sir Llewellyn Woodward has acutely pointed out that

'we know so many facts which lend themselves to arrangements in patterns that we can make any number of such patterns; but we do not know enough to judge between these patterns or to be sure that we are doing more than pick out chance or superficial resemblances'.⁴

Applying this consideration to my work, he justly comments⁵ that

'it would be possible to make an entirely different selection of facts and, as a result, to give an entirely different version of the development of Western Civilization during the last fifteen centuries'.

The same point is made by K. W. Thompson:⁶

'The cauldron of history is so immense and limitless that the individual historian can serve up but a tiny spoonful, and whether this can symbolise or represent the full mixture of history is always a most doubtful issue.'

This embarrassing wealth of alternative possible choices besets the student of human affairs when dealing with phenomena of the lower orders of magnitude. On the other hand, when dealing with phenomena of higher orders of magnitude—for instance, with civilizations or with 'higher religions'—he is embarrassed by a problem arising from the

¹ In spite of the evident difficulty of the enterprise, I feel fortified in my determination to persevere in it when I notice the line taken, on this issue, by a critic who has not treated me so benevolently as Sir Ernest Barker has. Philip Bagby concedes (in *Toynbee and History*, pp. 106 and 108) that 'there certainly seems to be some evidence for Dr Toynbee's (and Spengler's) thesis that there is a regular pattern of development of civilizations' and that 'a morphology of cultural and social forms and a general theory of culture-change may serve to reduce many of the puzzling phenomena to order'. In his own book, *Culture and History*, he says: 'I shall have one primary end in view, one particular problem which I wish to attempt to solve. It is the same problem which has chiefly engaged the attention of recent philosophers of history such as Spengler and Toynbee: that is, whether there is any regularity in the development of civilizations, in their slow growth and their sometimes rapid decline.' Towards the end of this volume of 'prolegomena to the comparative study of civilizations', in a chapter in which he examines some examples of similarities in the development of civilizations, Bagby takes the history of the Hellenic Civilization as his principal model. He applies this model first to the history of the Western Civilization up to date (pp. 205-10) and then to the other civilizations on his list (pp. 212-17).

paucity of his data at this level.¹ J. Madaule notes² that the specimens with which I am working are more scarce, besides being more complex, than a botanist's, and that the margin of error in my comparative study must be proportionately greater. It is true that the maximum number of civilizations that I originally believed I had identified is less than thirty, and for operational purposes the figure may have to be reduced considerably for various reasons. The 'arrested civilizations', as critics have pointed out,³ are a rather arbitrary selection; and two of them—the Spartan and the Ottoman—are also included in other civilizations on my list. The development of both the 'arrested' and the 'abortive' civilizations breaks off short at so early a stage that their utility for purposes of comparison is slight. And so is the utility of several of the civilizations that the archaeologists have disinterred—in this case, not because of evidence that they prematurely went to pieces or became petrified, but because the material debris of their culture, which the archaeologists have brought to light, do not enable us to reconstruct their spiritual or even their political history.

The number of specimens will be further reduced if my critics are right in contesting one of the results of my application of my Hellenic model. This model shows an earlier civilization, the Hellenic, being succeeded by a later one, the Western, that is 'affiliated' to it through a 'higher religion', Christianity, which serves as a 'chrysalis' out of which the new civilization emerges. Applying this model to Eastern Orthodox as well as to Western Christendom, I have assumed that the civilization of the Byzantine World, as well as the civilization of the medieval and modern West, is not a continuation of the Hellenic Civilization but is a successor to it with a separate identity of its own. Again, on the analogy of the role played by Christianity as a 'chrysalis', I have assumed that the same role has been played by Christianity's sister religion, Islam, and that the Islamic civilizations in the Iranic and Arabic worlds are therefore two more separate civilizations, on a par with the two Christian civilizations of Byzantium and the West. When the Hellenic model is applied to the history of civilization in India and China, it brings to light counterparts of itself there too, with the Mahayana playing Christianity's role in China and the post-Buddhaic form of Hinduism playing it in India. In previous volumes I have assumed that in these two subcontinents there has been a succession of civilizations, on the analogy of the series at the western end of the Old World. I have also assumed that there has been a similar succession in the Tigris-Euphrates basin and in Middle America, though in these two areas the break in the continuity of history was not signalized by a religious revolution. I made this series of assumptions tentatively and provisionally, in order to test how far it was borne out by the facts.⁴ Now that it has been tested by me in previous volumes and has been contested by a number of my critics,⁵

² In *Diogenes*, No. 13 (Spring, 1956), pp. 33-34.

³ See p. 548, footnote 5, and pp. 553-4.

⁴ See i. 117-18, 133-6, 146.

⁵ For example, my analysis of the histories of India and China into the histories of two distinct civilizations, one following the other in either case, has been rejected by M. Saville (*The Pacific Historical Review*, vol. xxv, No. 1 (February, 1956), pp. 55-67).

I must experiment with the alternative policy of assuming that in Middle America, the Tigris-Euphrates basin, India, and China, and perhaps in the domains of Byzantine Christendom and Islam as well, there has been, not a succession of civilizations, but a single continuous civilization in each case, as I have assumed that there has been in the Andean area down to the Spanish conquest and in Egypt down to its conversion to Christianity. After having operated with the maximum number of civilizations, it will be a useful check on the results of the manoeuvre to repeat the operation, this time with the minimum number. But this drastic reduction in the quantity of the specimens reinforces Madaule's point that the paucity of the data for the study of civilizations is a difficulty, besetting this study, with which botany, for example, does not have to contend.

The number of effective specimens would be reduced still farther if Dawson is right in challenging¹ my postulate of the 'philosophical equivalence' of all the civilizations, and my corresponding postulate in regard to the higher religions. In spite of my respect for Dawson's judgement, I should be reluctant to defer to it on this point. A specimen is a specimen, and, if we are satisfied that we have verified a particular specimen as being a genuine one, it seems hazardous to draw distinctions between this and other specimens on the ground of differential valuations that will inevitably be subjective and therefore disputable.² All civilizations and all higher religions alike, up to date, have fallen infinitely short of their ideals; all alike have risen far above the level of older species of human society. In this perspective it seems prudent to treat all specimens of each species as each other's equals.

3. A RETRIAL OF THE HELLENIC MODEL FOR CIVILIZATIONS

Under the new and more exacting conditions to which I have just committed myself, I will now repeat the experiment, made originally near the beginning of this book, of applying my Hellenic model to the rest of the field of the histories of civilizations. Before applying it, I will dissect it, and will then apply the component parts one by one. This procedure seems likely to be illuminating, because we shall find that and by E. I. Watkin (*The Tablet*, 12th August, 1939) in respect of both cases; by N. C. Chaudhuri in respect of the Indian case (in an unpublished communication to the writer); by W. Altree (*Toynbee and History*, p. 266), by E. C. Dyason (*The Australian Outlook*, March 1949), by M. S. Bates (*Christianity and Crisis*, vol. 15, No. 4 (2nd March, 1955), pp. 27-30 and 32), and by P. L. Ralph (in the *Saturday Review*, 16th October, 1954, p. 19) in respect of the Chinese case. Watkin also rejects (in loc. cit.) my distribution of the history of Islam between the histories of two series of civilizations, the Syriac followed by the Arabic and the Iranic. Chaudhuri regards civilization in India from about A.D. 1000 down to the beginning of the impact of the Western Civilization on India as being, not a new civilization, but a 'folk civilization' into which the previous classical civilization of India (the 'Indic' in my terminology) had lapsed.

An open-minded examination, by a specialist in Chinese history, of my analysis of this has been made in *The Pacific Historical Review*, vol. viii, No. 4 (December, 1939), under the title of 'A Bisection of Chinese History', by M. E. Cameron. After pointing out the number and importance of the strands of continuity in Chinese history, Cameron agrees (p. 411) that my "Far Eastern Civilization" does have a real character of its own as distinct from that of Chinese antiquity', though evidently she would not go as far as I have gone in drawing this distinction.

¹ In *Toynbee and History*, pp. 130-1 and 134. Cp. L. Mumford in *Diogenes*, No. 13 (Spring, 1956), p. 17.

² This point is taken up again on pp. 551-3.

different parts fit the phenomena in different degrees and in different numbers of instances. I shall keep in mind M. R. Cohen's counsel: 'Give special note to those facts that fail to fit into preconceived patterns.'¹

My Hellenic model comprises more than the internal history of the Hellenic Civilization. It also includes this civilization's relations with contemporary civilizations whose participants it annexed to its internal proletariat; its relations with Christianity; and finally its relations, through Christianity, with the subsequent Orthodox Christian and Western civilizations. This configuration of historical events can be analysed into the following elements.

One element is the configuration of the Hellenic Civilization's own political history. At the earliest stage of Hellenic history of which we have any record, there is a sharp contrast between the cultural unity of the Hellenic World and its political disunity. We find it divided up politically into a number of sovereign independent states whose citizens recognize that they are all partakers in a common culture yet are not inhibited by this from going to war with each other. In the course of time these fratricidal wars become so devastating that they bring the civilization to grief. When it is on the point of dissolution it wins a reprieve through the belated political unification of the Hellenic World in the Roman Empire. This brings temporary peace and order, but at the prohibitive price of a series of 'knock-out blows' ending in the overthrow of all political powers except for the one surviving victor. By the time when the Hellenic 'universal state' is established by Rome, the Hellenic World is already so seriously exhausted and demoralized that it proves incapable of maintaining its universal state in perpetuity; and the break-up of the Roman Empire spells the Hellenic Civilization's dissolution.

A second element is the configuration of the Hellenic Civilization's social history after its 'breakdown'. The leading minority in the society comes to depend more and more on force, and less and less on attraction, for maintaining its ascendancy. This change in the character of its relation with the majority alienates both the dominant minority's subjects within the Hellenic Civilization's domain and the primitive peoples beyond its borders who have previously been attracted towards it. These two classes turn respectively into an internal and an external 'proletariat' (in the sense of a class that is 'in' society but not 'of' it). The internal proletariat is swollen in numbers by the addition of barbarians from the external proletariat and of representatives of foreign civilizations who are forcibly incorporated in the Hellenic Civilization's internal proletariat through military conquest.

A third element is the configuration of the Hellenic Civilization's religious history in the same phase. The internal proletariat creates a higher religion, Christianity,² that draws its inspiration from one of the

¹ *The Meaning of Human History*, p. 114. The same advice is given by W. Kaufmann in *Toynbee and History*, p. 311.

² The proletarian origin of Christianity has been contested. K. D. Erdmann, for instance, maintains that it was never a mass movement (*Archiv für Kulturgeschichte*, xxxiii. Band, Heft 2 (1951), pp. 225-6).

non-Hellenic civilizations whose representatives have been incorporated in the Hellenic internal proletariat. Christianity converts the Hellenic World and also its barbarian invaders. An attempt to organize a counter-religion, Neoplatonism, professedly drawing its inspiration from native Hellenic sources, is a failure. The Christian Church, in which the Christian religion has taken social form, serves as a chrysalis out of which two new civilizations, the Eastern Orthodox Christian (*alias* Byzantine) and the Western Christian, eventually emerge after a cultural interregnum.

A fourth element is the part played by 'the external proletariat' (the barbarians). Their creativity expresses itself in epic poetry, and their nationalism in the adoption of Christianity in heretical forms (e.g. Arianism and Islam). The barbarians conquer the Hellenic universal state militarily and establish successor-states on its domain. But their contribution to the creation of the new civilizations is slight compared to 'the internal proletariat's' contribution. The matrix of the new civilizations is the Christian Church, not the Roman Empire's barbarian successor-states.

A fifth element is a series of 'renaissances' of the Hellenic culture in the course of the histories of the two 'Hellenistic' civilizations: the Byzantine and the Western. These renaissances are attempts to draw inspiration from Hellenism direct, and not merely indirectly through the medium of the Hellenic element in Christianity.

Bagby has arrived at much the same results as mine in constructing a model out of a stage-by-stage comparison of Hellenic history with Western history up to date.¹ But he has also included one important further element. He sees the course of each of these two civilizations as exhibiting 'a gradual process of "rationalisation"', which 'seems to come in two pulses or phases, two ages, one of Faith and one of Reason'.²

'Essentially this movement is one of growing rationalism and individualism. It reaches its creative peak in the seventeenth century in France (the Age of Louis XIV) and the fifth century in Athens (the Age of Pericles). This is the period when faith and reason are perfectly balanced, the period of the great triumphs of art and thought, when the basic forms of the civilization are laid down once for all.'³

It will be seen that if Bagby's schematization is superposed on mine his 'creative peak' of Hellenic history comes shortly before my 'break-down', which I equate with the outbreak of the Great Atheno-Peloponnesian War in 431 B.C. It corresponds, in fact, with 'the Half Century' (*pentekontaetia*) that ended in this catastrophe and that had opened with the triumph of Hellenism over the Persian invaders of Continental European Greece in 480-479 B.C.

Let us now see how far these several elements in my Hellenic model fit the histories of civilizations other than the Hellenic.

The combination of cultural unity with political disunity, which we find in the Hellenic World at the dawn of its history, appears to be widespread. It is the situation in all known living pre-civilizational

¹ *Culture and History*, pp. 205-10.

² *Op. cit.*, p. 209.

³ *Op. cit.*, p. 207.

societies, according to Bagby.¹ Its frequency is not surprising, for, after all, there are only two possible alternatives: if a society is not united politically, it is necessarily divided. So political disunity, taken by itself, is too general a feature to have much significance. The significant political configuration in my Hellenic model is the revolutionary change from disunity to unity as a result of a series of ever more devastating wars which have brought the civilization to grief before the political unity is achieved. And, in the histories of the civilizations, this configuration is a frequent one. For instance, it occurs—in unmistakable counterparts of the Hellenic pattern—in the histories of the Andean and Middle American civilizations (if we now regard civilization in Middle America as being continuous and unitary, and see the Aztec Empire as its universal state in the making). The same pattern is also unmistakable in the histories of the Syriac, Sinic, Indic, and Sumero-Akkadian civilizations, the Eastern Orthodox Christian Civilization in Russia, and the Far Eastern Civilization in Japan. Syria was unified politically in the Assyrian Empire and its successors the Neobabylonian Empire and the Achaemenian Empire, China in the Ch'in (Ts'in) and Han Empire after the period of 'the Contending States', India in the Maurya Empire after a similar period of fratricidal inter-state warfare, the Sumero-Akkadian World in the Empire of Agade and in the subsequent empire established by the Third Dynasty of Ur and re-established momentarily by Hammurabi, Russia in the Muscovite Empire, Japan in the unitary regime established by the Tokugawa Shogunate.² In the anatomy of Indian history the thesis that, since the end of the Indus Culture of the third and second millennia B.C., there has been a succession of two civilizations in India is supported by a second occurrence, in Indian history, of the Hellenic political configuration. From the eighth to the sixteenth century of the Christian Era India was divided politically, except for an ephemeral unification under Muslim rule in A.D. 1318-36, among a number of contending states, as she had been during the age before the establishment of the Maurya Empire in the fourth century B.C. In the sixteenth century of the Christian Era India was united politically in the Mughal Raj, and in the nineteenth century this political unity was re-established in the form of the British Raj.

We have now found, on reconsideration, that the political configuration of our Hellenic model is plainly discernible in nine other instances. There would be a tenth instance if I have been right in assuming, as I have assumed in volumes i-x, that there was a second occurrence of this pattern in the history of the Tigris-Euphrates basin, as well as in the history of India. In these earlier volumes I cast the Neobabylonian Empire for the role of universal state of a Babylonian Civilization affiliated to the Sumeric, but this attribution is perhaps dubious. The Neobabylonian Empire was only one of four successor-states of the Assyrian Empire, and it was not even the largest and most powerful of these. It lived in fear of its neighbour the Median Empire, which had taken the

¹ *Op. cit.*, p. 101.

² The role of the Tokugawa regime in Japanese history is discussed further on p. 207, footnote 2.

metropolitan provinces of Assyria as its share of the Assyrian spoils. Then should the Assyrian Empire itself be regarded as the universal state of a Babylonian Civilization? It was larger and longer-lived than any of its immediate successor-states, and its provincial administration was highly organized. Yet even the Assyrian Empire did not include the whole of the Babylonian World. It never succeeded in conquering the rival Empire of Urartu, which was a convert to the Babylonian culture. The Assyrian Empire has more in common with the abortive empire of the dynasty of Agade than it has with the Third Dynasty of Ur's and the First Dynasty of Babylon's Empire of Sumer and Akkad, which I have identified with the universal state of the Sumerian Civilization. To find a convincing universal state for a hypothetical independent Babylonian Civilization, we must wait for the Achaemenian Empire, and this, even if it started its career as a vehicle of the Babylonian Civilization, had become the vehicle of a different civilization, the Syriac, before its overthrow. It will be seen that we cannot identify a Babylonian universal state with confidence, and this tells against my earlier thesis that there was a Babylonian Civilization, separate from, and successive to, the Sumerian-Akkadian. An interpretation of the civilization of the Tigris-Euphrates basin at this later stage as being a continuation of the Sumerian-Akkadian Civilization might be less open to question.

In the history of the Egyptian Civilization the political configuration of our Hellenic model can be identified if it is accepted that there was a period in which the nomes (cantons) of Egypt were so many sovereign independent states, perpetually going to war with each other, and that this was followed by a period in which first Upper Egypt and then the whole of the Nile Valley below the First Cataract was united politically in the so-called 'Old Kingdom'.¹ This configuration conforms to the Hellenic model, but the chronology does not. In the history of the Hellenic Civilization the revolutionary change from disunity to unity on the political plane came in the last chapter of the story, after the warfare between the contending states had not only brought the Hellenic Civilization to grief but had carried it to the verge of dissolution. In the history of civilization in Egypt there was the same revolutionary change, but it came at the very beginning. The age, if there was one, of the contending Egyptian cantons was 'prehistoric' in the sense of being 'pre-civilizational'. In Egypt political unification was simultaneous with the dawn of civilization, and it was followed by the most creative period of Egyptian history instead of being followed by dissolution and preceded by breakdown and disintegration, as it was in Hellenic history. When we find an identical configuration in the histories of two civilizations appearing at two quite different stages and performing two quite different functions, this suggests that the common feature may mask a radical difference between the fundamental structures of the two histories.²

¹ This view has certainly been widely held among Egyptologists in the past. However, E. J. Baumgartel, in *The Cultures of Prehistoric Egypt*, revised edition, p. 12, maintains that 'it is not generally recognised that the nomes are survivals of pre-Menite states'.

² This radical difference is pointed out by Richard Pares in *The English Historical Review*, vol. lxxi, No. 279 (April, 1956), p. 262, by F. Borkenau in *Commentary*, May,

This impression is strengthened when we turn to a chapter in the history of China which, in the preceding volumes, I have treated provisionally as the history of a civilization separate from, and successive to, the Sinic. I have just reaffirmed my view that the configuration of Sinic history, down to and including the universal state established and maintained by the Ch'in (Ts'in) and Han dynasties, conforms closely to my Hellenic model. Moreover, the fall of the Han Empire, like the fall of the Roman Empire, was followed by a relapse into political disunity. But the emergence of the new Far Eastern Civilization—if a new civilization did emerge in China—was followed, almost as quickly as the emergence of the Egyptiac Civilization in Egypt, by the establishment of political unity. If the dawn of the Far Eastern Civilization is to be regarded as having been subsequent to the cultural interregnum following the break-up of the Han Empire at the turn of the second and third centuries of the Christian Era, then the empire in which China was united politically under the Sui and T'ang dynasties, from the close of the sixth century to the early years of the tenth, corresponds to the Old Kingdom in Egyptiac history. Thus, if there was such a thing as a separate Far Eastern Civilization that was not a mere continuation of the Sinic, the structure of this Far Eastern Civilization's history does not conform, as the structure of the preceding Sinic Civilization's history does, to my Hellenic model; it conforms to a different model presented by the political history of the Egyptiac Civilization. Moreover, the structure of the West's sister-civilization, the Eastern Orthodox Christian or Byzantine, conforms to the Egyptiac model likewise. In Eastern Orthodox Christendom the interregnum following the break-up of the Roman Empire was immediately succeeded by the establishment of political unity through a successful revival, here, of the Roman Empire—an achievement that presents a sharp contrast to the series of abortive revivals of the Roman Empire in the West from Charlemagne's attempt onwards.¹

The second element in my Hellenic model—the disintegration of a broken-down society into an internal and an external proletariat—does occur in a considerable number of non-Hellenic instances. These have been surveyed at length in volume v, and there is no need to recapitulate this survey here. In Hellenic history this second element is closely associated with the third: the creation, by the internal proletariat, of a 1955, p. 240 ('the universal state marks the beginning, not the end, of Ancient Egypt's history'), and by D. Halévy in a French journal that I have not been able to identify, p. 59. It has been noted by P. Bagby (in *Culture and History*, p. 219) and by F. Hampl (in the *Historische Zeitschrift*, Band 173, Heft 3 (1952), p. 459) that the configuration of Egyptiac history will not conform to the Hellenic model. R. Coulborn (in *Toynbee and History*, p. 159) submits that The Old Kingdom of Egypt is clearly a universal state in the sense in which I use this term.

¹ These revivals of the Roman Empire in the West were so ineffective, and made so little mark on Western history as a whole, that K. D. Erdmann seems hardly warranted in maintaining, on the strength of them, that Western history begins with a universal state (*Archiv für Kulturgeschichte*, xxxiii. Band, Heft 2 (1951), p. 243). A slightly better case might be made for the thesis that Chinese history begins with a universal state. Yet the Chou regime, even in its first phase, was hardly more effective than the resuscitated Roman Empire in the West; it is not comparable to the Ch'in (Ts'in), Han, Sui, and T'ang regimes in point of solidity. As for the Chou's predecessors the Shang, the progress of archaeological discovery has not yet revealed either the extent or the structure of their rule. See further p. 190.

higher religion in which the inspiration comes from a foreign source. This third element is a key-part of the model, since the church in which the higher religion embodied itself in the Hellenic case served as the chrysalis out of which two new civilizations emerged. It is therefore important to reconsider whether the pattern of the history of the Christian Church is a standard one which can be detected in a number of other instances, or whether it is something exceptional.

In order to test this we must first analyse this pattern into its elements. The Christian Church arose among the proletariat of one disintegrating civilization; its inspiration came from a different civilization; it easily overcame a counter-church professedly inspired by the native traditions of the civilization in whose domain the victorious church had made its appearance; the victorious church converted the world in which it had triumphed, and also this world's barbarian invaders. It brought to birth two new civilizations which can hardly be regarded as being mere continuations of the preceding Hellenic Civilization within whose bosom Christianity had made its first appearance. It is true that the Western and Byzantine civilizations are Hellenistic, but they are distinguished from the Hellenic Civilization itself by being also Christian, and Christian from the start.

Perhaps the closest parallel to the history of Christianity at the western end of the Old World is the history of the Mahayanian version of Buddhism at the eastern end of it. The source of the Mahayana's inspiration, like the source of Christianity's, was foreign to the world in which the rising religion made its fortune. Christianity made its fortune in the Hellenic World but drew its inspiration from a Syriac source; the Mahayana made its fortune in the Sinic World but drew its inspiration from an Indian source. Again, the Mahayana made its way among the proletariat of the Sinic society, in the sense that it attracted native Chinese who were in revolt against the Confucian tradition and barbarian invaders who were suspicious of it.¹ Furthermore, the progress of the Mahayana evoked a counter-church, the Taoist Church, which was remarkably similar to the Neoplatonist Church in being constructed out of a native philosophy to combat a foreign religion and in trying to steal

¹ 'Buddhism commended itself to the [barbarian] rulers because it was not Chinese' (A. F. Wright: 'Buddhism and Chinese Culture: Phases of Interaction', in *Journal of Asian Studies*, vol. xvii, No. 1 (November, 1957), pp. 17-42, on p. 28; idem: *Buddhism in Chinese History* (1959), p. 57). Shih Hu, a barbarian ruler of the later Chao Dynasty, remarked in an edict that 'Buddha, being a barbarian god, is the very one we should worship' (Wright, 'Buddhism and Chinese Culture', p. 28). W. Altree points out (in *Toynbee and History*, pp. 260-1) that in China 'Buddhism received its support from emperors, scholars, and men of affairs', and on this ground he contests my description of it as being a proletarian movement. This is also contested by K. D. Erdmann (loc. cit., p. 226). Altree and Erdmann have not, however, taken the point, made by Wright (*Buddhism in Chinese History*, p. 44), that, during the three centuries of political division (circa A.D. 300-600), Chinese civilization developed on different lines in the South and in the North, so that Buddhism had to adapt itself in China to two evolving cultures. In the South, during this age, an aristocracy was in political control (ibid., pp. 51-52); and Buddhism did here take its social impress from its aristocratic patrons. In the North, on the other hand, Buddhism 'cut across class lines and helped to unite a divided society' (ibid., p. 59). In the North the peasantry was converted to Buddhism *en masse* (ibid., p. 58). It is also significant, however, that 'an overwhelming majority of the literate class' stayed in the North (ibid., p. 55), in spite of the adverseness of conditions for them there under barbarian rule, and maintained themselves there in sufficient numbers to be able to reassert their power as soon as the opportunity came.

this foreign religion's thunder by imitating those features of it that made it attractive.¹ These resemblances between the Mahayana and Christianity are impressive; but beyond this point the histories of the two religions do not any longer run parallel.²

In the Western and Byzantine worlds Christianity won a monopoly which it retained for centuries, even if it is losing it now. The Neoplatonist counter-church, as well as the four established Hellenic philosophies—Platonism, Aristotelianism, Stoicism, Epicureanism—have all been stone-dead by now for at least fourteen hundred years. Hellenism has survived only in so far as Christianity chose to incorporate it into itself. Byzantine and Western attempts at renaissances of Hellenism drawn direct from the fountain-head have been superficial and ephemeral. In so far as the Western and Byzantine societies are now ceasing to be Christian, they are still inescapably ex-Christian. Their cultural heritage is so thoroughly saturated with Christianity that it is impossible for them to disengage themselves from their Christian past (as is demonstrated, for example, by the transparentness of the Communist ideology's Judaeo-Christian origins). In Eastern Asia history has run a less revolutionary course. Here the Mahayana never succeeded, even at the height of its vigour and power,³ in driving off the field either the

¹ The Taoist counter-church differed, however, from the Neoplatonist counter-church in representing a popular movement of revolt against a decadent Confucian official regime (see, for example, Wright, 'Buddhism and Chinese Culture', p. 20; *Buddhism in Chinese History*, pp. 26-30), whereas Neoplatonism was the creation of a 'highbrow' minority. This is one of the reasons why Taoism survived, while Neoplatonism went under.

² 'The role of Buddhism in China is not fully comparable to that of Christianity in Europe' (M. E. Cameron in *The Pacific Historical Review*, vol. viii, No. 4 (December, 1939), p. 406). The Rev. E. R. Hardy Jr. queries whether I do not 'look too eagerly for a period sometime when China was Buddhist in the same way that mediaeval Europe was Catholic' (*The Intent of Toynbee's History: A Cooperative Appraisal*).

³ At its height, the vigour and power of the Mahayana in China was so great that, to a Western observer, it is surprising that in the end the Mahayana should have failed to win the decisive and definitive victory that Christianity did win in the Byzantine World and in the West. Buddhism interacted with the indigenous Sinic culture at all levels, among the peasantry as well as among the élite (Wright, 'Buddhism and Chinese Culture', p. 18). The Buddhist village clergy were recruited from the peasantry and remained in touch with it, and 'Buddhism became deeply interwoven with common life in the North' (*ibid.*, p. 30). Under the Sui and T'ang regimes the domesticated elements of Buddhism were accepted (pp. 31-32), and in the T'ang Age, in spite of an archaistic revival of Confucianism, 'Buddhism remained the dominant intellectual, spiritual, and aesthetic interest of the educated' (p. 33). Metropolitan Buddhist clerics and government officials were social equals (p. 34). In the T'ang Age Buddhism was also practised by the peasantry *en masse*. 'For the peasantry, as for the gentry, Buddhism became an accepted part of individual and group life' (p. 34). Original and distinctively Chinese schools of Buddhism emerged: e.g. the 'Pure Land' school (Amidism), Ch'an (in Japanese, Zen), and T'ien-t'ai (in Japanese, Tendai) (pp. 34-36). On this evidence, Buddhism in China might have seemed to be carrying all before it, as Christianity did in the Byzantine and Western worlds.

From first to last, however, Buddhism had two serious handicaps to contend with, one political and the other intellectual. Chinese governments, even at their nadir, were jealous of possible rival authorities and were efficient enough to be able to take measures for keeping them in check. The northern governments' inclination towards Buddhism did not deter them from setting up a Buddhist clerical bureaucracy, responsible to the Crown, for keeping Buddhist institutions and property under the control of the state; and, in A.D. 446-52 and A.D. 574-8, attempts were made to impose drastic restrictions on Buddhist organizations and activities (*Buddhism in Chinese History*, pp. 60-61). These attempts ended in failure; yet the state's relation to Buddhism in the North was closer to Caesaro-papism than it was in the South (*ibid.*, p. 62). After the reunification of China the device of setting the Buddhist hierarchy to control itself on the state's behalf was taken over by the Sui and T'ang regimes (*ibid.*, p. 68; 'Buddhism and Chinese Culture',

Taoist counter-church or Confucianism, which was the established Sinic philosophy.¹ In China at the opening of the twentieth century Confucianism and Taoism, as well as the Mahayana, were still alive, and this was more than eighteen hundred years after the Mahayana had made its first lodgement in China, and more than a thousand years since the end of the Mahayana's partial ascendancy, which had lasted from the break-up of the United (Western) Chin (Tsin) regime early in the fourth century of the Christian Era down to the official persecution of Buddhism in A.D. 842-5.²

Taoism held its own against the Mahayana; Confucianism regained the upper hand over it. Confucianism had had a monopoly of being the official philosophy of the civil service of the Sinic universal state since the reign of the Prior Han Emperor Wu-ti (140 B.C.-87 B.C.). In the age of the Posterior Han Dynasty (A.D. 25-220) the Confucian-educated land-owning gentry, from which the civil service was recruited, had established its ascendancy in the Sinic society;³ and, from that time onwards till the abandonment in A.D. 1905 of the periodical examinations in the Confucian classics for candidates for entry into the civil service, this gentry kept itself in being.⁴ In the fourth, fifth, and sixth centuries, when the North was under the rule of Eurasian Nomad barbarians, the Confucian-educated indigenous Chinese gentry had an inviolate citadel in the South, which had been conquered and annexed by the Han Empire just at the time when Confucianism had been established as the official philosophy of the Sinic universal state. During the next four

p. 33). Under the T'ang, active persecution of Buddhism was resumed, and this time more effectively, in A.D. 842-5. Buddhism's intellectual handicap in China was even more formidable than its political one. The contrast between the structures of the Chinese and Sanskrit languages, and between the traditional styles of the two literatures, was extreme (*Buddhism in Chinese History*, p. 33). The propagators of Buddhism in China 'all had a common inclination to graft the alien on to native roots' (ibid., p. 40). In China, Sanskrit never became a 'church language'. 'Most, if not all, of the seminal thinkers and founders of schools of Chinese Buddhism knew only Chinese' (ibid., p. 76).

¹ So far from that, the indigenous ideologies 'spoiled the Egyptians'. In the encounter between them and the Mahayana, 'the Taoists stole its ritual and the Neo-Confucians its philosophy' (V. K. Ting, quoted by Cameron, loc. cit., p. 408). From the fifth century of the Christian Era onwards, popular Taoism gradually ousted popular Buddhism by copying it (*Buddhism in Chinese History*, pp. 97-98). From about A.D. 900 onwards elements of Buddhism were appropriated by the Sinic culture by being fitted into the framework of the Confucian philosophy (Wright, *Buddhism in Chinese History*, pp. 89-90; 'Buddhism and Chinese Culture', pp. 38-39). The Neo-Confucian school gleaned 'from the Confucian tradition those ideas and formulae which answered, on the authority of native philosophers, many of the questions which Buddhism had raised in men's minds' (ibid., p. 38). Wright (ibid., p. 39) quotes G. E. Sargent for the view that 'Neo-Confucianism constitutes less an autonomous system than a complex of responses to Buddhist theories.' In fact the Neo-Confucians 'proved to be in many ways the captives of the tradition they sought to replace' (*Buddhism in Chinese History*, p. 90). Wright agrees that Wang Yang-ming was truly a Buddhist in disguise; Wang's philosophy was Ch'an Buddhism in Confucian dress; but Wright comments that this Confucian disguise was all-important (ibid., pp. 91-92; 'Buddhism and Chinese Culture', p. 39).

² After that, Buddhism was never again regarded as being an essential adjunct of state power and 'Buddhist ideas ceased to be the common coin of intellectual life', while Taoism made inroads on popular Buddhism (Wright, 'Buddhism and Chinese Culture', p. 38).

³ See B. Watson: *Ssu-ma Ch'ien, Grand Historian of China*, pp. 37-38; A. F. Wright: *Buddhism in Chinese History*, p. 9.

⁴ 'By the Later Han, the number of students enrolled in the State University had grown to over 30,000. It was from this group that officials were appointed' (A. F. Wright: *Buddhism in Chinese History*, p. 15).

hundred years the South had been opened up and Sinified just sufficiently to provide an asylum for the traditional Chinese regime in its hour of need.¹ In the thirteenth century the Mongol barbarians conquered the whole of China, and Tongking and Upper Burma as well. But even without a southern citadel the gentry survived once again. Their close-knit network of family connexions was an invisible citadel in itself; and this, combined with a monopoly of the understanding of China's *arcana imperii*, made them indispensable and therefore invincible. The fourth-century barbarian rulers in the North tried to govern their Chinese subjects through the agency of Taoist and Buddhist administrators; the Mongols imported Muslim and Christian administrators;² but, sooner or later, all rulers of China before the Westernizing revolution of A.D. 1911 had to call in the Confucian-educated native Chinese gentry to make the wheels of public administration go on turning, however unsympathetic the rulers of the day may

¹ The importance, in Chinese history, of this southern citadel has been noticed in this Study already in vii. 357, footnote 1, and in ix. 655-7, 670-1, 675. In these passages I have recognized that the citadel enabled the gentry to survive and so eventually to re-emerge and recapture the administration of a reconstituted Sinitic universal state. Cameron has pointed out (loc. cit., p. 409) that at the close of the Han Age the South, though now politically part of China, was culturally virgin soil, and that it was the great migration to the South under pressure of the barbarian invasions of the North in the fourth century of the Christian Era that led to the South's being culturally assimilated. As she truly observes, the existence of this city of refuge in the South made the maintenance of cultural unity possible, and this accounts for the affinity of the T'ang culture with the Han culture.

Even so, the continuity was maintained only with difficulty. Wright points out that during the years A.D. 317-589, during which China was politically divided, 'two widely different cultures developed in North and South' ('Buddhism and Chinese Culture', p. 24; *Buddhism in Chinese History*, pp. 43-44). The members of the ruling class who fled to the South 'found themselves in a rich but recently colonial area, much of it still populated by aborigines. They felt themselves exiles and behaved like émigrés; their mood was a compound of chagrin, self-pity, and deep self-doubt' ('Buddhism and Chinese Culture', pp. 24-25). 'In climate, landscape, crops, diet, and architecture', the South 'contrasted sharply with the northern plains on which their ancestors had begun to shape a distinctive Chinese civilization' (*Buddhism in Chinese History*, p. 43). The maze of waterways in the Hwai and Yangtse basins saved the southern citadel of Sinism from being overrun by the pursuing Nomad cavalry, but not from being exposed to the infiltration of the invading Indian religion. 'Many of the leading members [of the emigration] were born members of the aristocracy; they tended to move from "Confucian" basic education to an interest in neo-Taoism, and thence to Buddhism' ('Buddhism and Chinese Culture', p. 25). Neo-Taoism fitted into the South China landscape (*Buddhism in Chinese History*, p. 45). It opened the way for Buddhism by breaking the shell of Confucianism and by raising questions that could not be answered from the Taoist scriptures (ibid., p. 46). The virtuous but aristocratic and worldly hero of contemporary Indian Buddhism, Vimalakirti, became for them the ideal hero, outshining the ideals of the Confucian gentleman and the Taoist sage (ibid., p. 52; 'Buddhism and Chinese Culture', p. 25). A new environment and a new religion worked together to produce cultural change. The emigrant society in the South made new contributions to Chinese culture: calligraphy, landscape painting, poetry, the drama, the novel, Neo-Confucianism, critical scholarship (Cameron, loc. cit., pp. 410-11). There is a Chinese saying that, 'with the southward migration, philosophy began' (ibid., p. 411). All this is like the effect on present-day Chinese civilization of the westward migration of the 'intellectuals' in A.D. 1936-45 under pressure of the invading Japanese armies.

Thus the cultural continuity which the existence of the southern citadel made possible in the fourth, fifth, and sixth centuries was a continuity shot through with change, rather than continuity pure and simple. Even so, it presents a contrast to what happened at the opposite end of the Old World after the barbarian invasions of the Roman Empire. Hellenism found no comparable citadel—for instance, not in Byzantine Anatolia, which was repeatedly overrun by Persians and Arabs and was partly repopulated by immigrant Armenians and Slavs. Consequently there was no comparable perpetuation of the Hellenic Civilization.

² e.g. Sayyid Ejell and the Polos.

have been towards Confucianism, and however reluctant they may have been to place themselves in the gentry's hands.¹

Though I happen to have been born in a former province of the Roman Empire, I was born there too late to have a chance of meeting a Stoic-educated Roman civil servant in the flesh. It would already have been too late in Britain if I had been born there, not in A.D. 1889, but in A.D. 489. But, if I had been born in 1889 in China, I should have seen Confucian-educated civil servants still administering the Sinic universal state. This universal state, the traditional system of administering it, the civil service which knew how to make the system work, and the Confucian-educated gentry that was the civil service's perennial source of recruitment constituted, together, one single great integrated institution. The continuity of this institution may be held to have counted for more than even the most violent of the breaches in the continuity of other elements of civilization in China; and, on this showing, my critics will have been right in maintaining that, notwithstanding the conformity of Chinese history to my Hellenic model down to, and including, the unitary regime of the Ch'in (T's'in) and Han dynasties, this is not enough to justify my provisional thesis that the history of civilization in China since the interregnum following the fall of the Han Empire has been the history of a new civilization,² in the sense in which the history of the West, since the interregnum following the fall of the Roman Empire, has been a new chapter of history that cannot be written off as being nothing but a continuation of the history of the Hellenic Civilization.

A denial of the separateness of the Western and Byzantine civiliza-

¹ 'The decisive factor' in the decline of Buddhism in China 'was the revival of the native tradition of Confucianism by an important segment of the Chinese élite. The Sui founder [Sui Wen-ti, originally Yang Chien] regarded Confucian teachings as arid and boring; many of the T'ang monarchs were personally Buddhists or Taoists. Yet from the time of reunification onwards the rulers adopted more and more of those measures of traditional Chinese statecraft which are usually associated with Confucianism; neither Taoism nor Buddhism had developed any such arsenal of social and political formulae. And one of the measures which [were] taken was the restoration of the examination system for the recruitment of officials. The content of the examination questions was, throughout most of the T'ang, intellectually trivial, anachronistic, and—since Confucian texts represented many stages of China's philosophical development—remarkably heterogeneous. Yet, from the beginning of the seventh century, young men were studying these texts in the hope of advancement, even though their intellectual interests might be in Buddhism or Taoism' (Wright: 'Buddhism and Chinese Culture', pp. 37-38; Cp. *Buddhism in Chinese History*, pp. 66, 86, 87).

As the same scholar puts it in another study, Sui ideology appealed to the ranking values of Buddhism and Taoism and to the residual values of endemic Confucianism (A. F. Wright: 'The Formation of Sui Ideology, 581-604', in *Chinese Thought and Institutions*, ed. by J. K. Fairbank (Chicago 1957; University of Chicago Press, pp. 71-104 and 352-63), on p. 73). Yang Chien was born in a Buddhist temple and was educated by a Buddhist monk up to the age of thirteen (*ibid.*, p. 77). His wife, too, was a devout Buddhist (*ibid.*, p. 78). The pair used to attend Buddhist services every night (p. 78). After his achievement of political reunification in A.D. 589, Yang Chien still relied chiefly on Buddhism (p. 93). Yet at the beginning of his reign he made use of Confucianism to consolidate his rule (p. 88), and thereby opened the door for the progressive re-establishment of a Confucian regime at Buddhism's expense. The T'ang emperors, in their turn, relied on Confucianism, though they preferred Taoism (Cameron, *loc. cit.*, pp. 407-8).

² In *Toynbee and History*, p. 266, W. Altree lists, as being common to the two phases of history in China that I have labelled with the names of two different civilizations, the following major elements: 'Confucianism, the highly centralised state, the agrarian economy, the bureaucracy, the aristocracy founded on literary achievement.' Cp. E. Dyason in *The Australian Outlook*, March, 1949, p. 59, and M. S. Bates in *Christianity and Crisis*, vol. 15, No. 4 (21st March, 1955), pp. 27-30 and 32.

tions from the Hellenic Civilization would be the logical consequence of substituting a Sinic model for the Hellenic one that we are applying at the moment.¹ But an interpretation of the history of the western end of the Old World in Sinic terms will demonstrate that the Sinic model is not applicable here, any more than the Hellenic model is applicable to the history of Eastern Asia since the fall of the Han Empire. The divergence between the courses of the two streams of history from this point onwards turns on the difference between the subsequent fortunes of Christianity at the western end of the Old World and of Buddhism in Eastern Asia.

In analysing the interaction between Buddhism and the Sinic Civilization on which it impinged, Wright² presents the drama in four acts: a period of preparation (A.D. 65-317); a period in which the invading Indian religion became domesticated in its new Sinic environment (A.D. 317-589); a period in which it won acceptance in the Sinic Society and developed new, and specifically Chinese, schools of Buddhist thought and practice on Chinese soil (A.D. 589-circa A.D. 900); and a period in which it has been appropriated³ by the Sinic Civilization (circa A.D. 900 to the present day).

'We find the Chinese returning again and again to the ideal of a monolithic society, economy, and polity, supported and rationalised by a thought system that is wholly consistent with itself and with the institutions it supports. The Han order approximated this ideal, and, in the Sui and the T'ang, Buddhism was more or less successfully integrated into the effort to recapture the Han ideal. Later, however, when circumstances had changed, the Sung synthesis rejected any separate and distinctive Buddhism as in conflict with the ancient holistic ideal of Chinese civilization, and appropriated only such parts of the faith as were compatible with this ideal. . . .⁴

'Periods of disintegration and the loss of holistic and related ideals are the only periods in which Chinese have shown any responsiveness to alien ideas.'⁵

Let us apply the plot of this Sino-Buddhist drama, as Wright has presented it, to the history of the western end of the Old World, setting the dates forward by 200 years, since the Roman Empire took shape and broke up approximately that much later than the Han Empire. A period of preparation, dated A.D. 265-517, would fit well enough; and a period, dated A.D. 517-789, in which Christianity was domesticated in what had

¹ The unity of both the Byzantine and the Western Civilization with the Hellenic has, in fact, been affirmed by some scholars. E. R. Curtius, for instance, has pleaded for a study of the Hellenic and the Western civilizations as a unity, especially on the plane of literature. The field of literary study ought, Curtius maintains, to be 'from Homer to Goethe' (*Merkur*, 1. Jahrgang, Viertes Heft [Heft 4] (1947), pp. 492-3). But that would require us to ignore the Jewish vein in Western literature, and this is not less potent than the Hellenic vein. The Syriac-Hellenic culture-compost from which the Western Civilization has sprung is so closely compacted and so nicely balanced that it would be unrealistic to treat the Western Civilization or any of its four sisters as being either Hellenic or Judaic exclusively.

² In 'Buddhism and Chinese Culture', p. 19.

³ Wright has chosen this term carefully, and insists on its exact meaning. 'The appropriation of Buddhism was not a process of "absorption" in the sense of swallowing up, assimilation without a trace' (*Buddhism in Chinese History*, p. 107. Cp. p. 125).

⁴ Wright: *ibid.*, pp. 123-4.

⁵ *Ibid.*, p. 124.

been the Hellenic World, would also pass muster. A period dated A.D. 789—*circa* A.D. 1100, in which Christianity was fully accepted and began to put forth new shoots, seems to fit extremely well. But what shall we say of a period, running from *circa* A.D. 1100 to the present day, in which Christianity is 'appropriated' by a resurgent Hellenic Civilization? We cannot bring this last of the four transferred Sinic formulae into any relation with the Western historical facts, even when we have made the most that can be made of the twelfth-century Western philosophical renaissance of Hellenism and the fifteenth-century Western literary, artistic, and political one. No presentation of Western history can make sense of the proposition that, in the course of the last eight and a half centuries, Christianity has been appropriated by the Hellenic Civilization on which it impinged in the days of the Roman Empire; for, whatever may have happened to Christianity during this latest age, it is certain that the Hellenic Civilization was extinct long before the beginning of the twelfth century. At the western end of the Old World the present age is a Post-Hellenic age. It is the age of two Hellenistic Christian or ex-Christian civilizations. It is evident that the Sinic model does not fit either the history of Christianity or the history of civilization at the western end of the Old World since the fall of the Roman Empire any better than the Hellenic model fits the history of Buddhism and the history of civilization in Eastern Asia since the fall of the Han Empire. In this chapter of history the two regions display two different historical configurations. In Eastern Asia continuity prevails, on the whole, over discontinuity; at the other end of the Old World it is the other way round.

This issue of continuity versus discontinuity is raised by the contrast between Christianity's triumph in the former domain of the Hellenic Civilization and Buddhism's failure to achieve the same apparently manifest destiny in Eastern Asia. The same issue is raised in regard to the history of civilization in India by a metamorphosis of indigenous Indian religion which was so revolutionary as to be comparable to the introduction of foreign religions—the Mahayana and Christianity—into China and the Hellenic World.

In the course of the last two centuries B.C. and the early centuries of the Christian Era, Indian religion underwent a transformation like the contemporary transformation of the Buddhist philosophy into the Mahayana. The religion that had been introduced into India by her Aryan invaders at some time during the latter part of the second millennium B.C. had much in common with the religion of the Aryas' kinsmen who had invaded Europe. The Aryan pantheon resembled the Hellenic: it was imagined in the likeness of a barbarian war-band. The Aryan religious ritual resembled the Roman: what mattered was correct procedure—the right form of words and the right physical gestures. The worshippers' approach to the gods was magical, or, in so far as it was rationalized, legalistic. But, before the close of the first millennium of the Christian Era, the Indian religious landscape had changed out of all recognition. The Aryan religious scriptures, while still nominally sacrosanct and authoritative, had practically been shelved in favour of

what purported to be no more than a commentary but was virtually a new canon. The gods were now represented in visual form in graven images, as the Buddha and the bodhisattvas had been represented since the irruption of the Hellenic Civilization into India in 183 B.C. after the fall of the Maurya Empire. These images of the gods were eventually housed in temples; and the gods were no longer conceived of as being a troop of superhuman military adventurers. The latter-day Hindu gods, whether they are survivors of the Aryan pantheon or revenants from the Pre-Aryan world of the Indus Culture, are awe-inspiring individual figures, each representing some facet of Absolute Reality. The relation between each of them and her or his worshippers is a personal one which is highly charged with emotion. The god is a fount of grace and the worshipper is the god's devotee. It is, in fact, the relation that, in the Buddhist fold, grew up simultaneously between the devotee and his chosen bodhisattva in the course of the evolution of the Mahayana.

This was a change of religious climate in India that was of the same order of magnitude as the change produced in Eastern Asia by the arrival of the Mahayana and at the western end of the Old World by the arrival of Christianity. Was the consequent break of historical continuity in India great enough to warrant us in regarding what followed as being the history of a new civilization affiliated to, but distinct from, the antecedent Indic Civilization, as the Byzantine and Western Christian civilizations are distinct from, though affiliated to, the Hellenic Civilization? Or shall we judge that in India, as in China, the break in continuity, while comparable, as far as it went, to the break separating the Hellenic Civilization from its successors, was more than offset by the survival of elements of the antecedent culture which managed to weather the religious revolution? In the history of civilization in China continuity prevailed over discontinuity, as we have seen, owing to the survival of a social class with a potent cultural heritage: the Confucian-educated gentry which was a potential seminary for civil servants capable of rehabilitating the Sinic universal state that had originally been established by the Ch'in (Ts'in) and Han dynasties. If we apply this Chinese clue to a further examination of Indian history, we shall find that, in India as in China, historical continuity was maintained by the survival of a social class occupying a key position.

In Indian society the master activity was not the civil administration, as it was in Chinese society; it was the religious ministry. The Brahman caste was therefore the Indian counterpart of the Chinese Confucian-educated gentry; and the Brahmans managed to maintain their monopoly of the religious ministry in India in spite of the radical transformation of the spirit, as well as the practice, of Indian religion in the course of a millennium running from the beginning of the second century B.C. In view of this parallel between Indian and Chinese history at this stage, it will perhaps be prudent to suspend my provisional division of the history of India into the histories of two civilizations, one following the other. There is perhaps more to be said in favour of this division in the Indian case than there is in the Chinese. We have seen that, in

addition to the religious revolution which Indian history has in common with Chinese history and with my Hellenic model, the political configuration of the Hellenic model—disunity eventually replaced by unity as a result of a long series of devastating wars—recurs in Indian history in the chapter following the religious revolution, in contrast to the corresponding chapter of Chinese history, which does not conform to the Hellenic pattern, but takes an Egyptiac course. All the same, the maintenance of the Brahmans' monopoly of the religious ministry gives Indian history a continuity,¹ throughout the period running from the Aryan invasion to the impact of the West, which is comparable to the continuity of Chinese history since the rise of the Confucian-educated gentry, and which has no parallel in the history of the western end of the Old World.

In 1930, when I was writing the first volume of this book, I believed, on the authority of a leading Egyptologist, J. H. Breasted, that the history of the Egyptiac Civilization afforded, in the worship of Osiris, an example of a religious movement which closely resembled the history of Christianity.² In the worship of Osiris 'we are confronted', according to Breasted,³ 'by a religion of the people, which made a strong appeal to the individual believer'—in contrast to the worship of Re the sun-god of Heliopolis, whose worship was part of the prerogative of Pharaoh and his court. Re was believed to bestow immortality on Pharaoh and his immediate entourage at the price of the building of pyramids. The labour required for this was a grievous burden on the people's shoulders, and it brought the labourers no return in the shape of immortality, which, for Egyptians of all ranks, was the supreme goal of human endeavours. The people gave their devotion to Osiris because he offered the possibility of immortality for all men. The Osirian religion, as presented by Breasted, has a striking resemblance to Christianity in its popular appeal; and the resemblance would be still closer if it were proven that the Osirian religion was not indigenous in Egypt but was a version of the Sumeric worship of Tammuz.

However that may be, the surviving Egyptiac literature of the age of the Middle Empire does testify that, in the latter days of the Old Kingdom, there had been a 'secession of the proletariat' in the sense in which the term is used in this Study. Later evidence—for instance, the Book of the Dead—also testifies that eventually the people did achieve their ambition of securing a possibility of immortality for all men, and achieved it through the worship of Osiris. Breasted's successors have, however, now rejected Breasted's theses that the Osirian religion was originally a specifically popular one, that there was an opposition, in the latter days of the Old Kingdom, between the worship of Osiris and the worship of Re, and that this religious conflict was the reflection of a

¹ The Rev. E. R. Hardy, Jr. queries whether I do not 'exaggerate the difference between modern Hinduism and previous stages of Indian religion' (*The Intent of Toynbee's History: A Cooperative Appraisal*).

² See p. 95, footnote 1. Breasted's interpretation of this chapter of the religious history of the Egyptiac World is expounded in *The Development of Religion and Thought in Ancient Egypt* (London 1912, Hodder & Stoughton).

³ Op. cit., p. 140, quoted in the present work in i. 141.

social one.¹ On this now current interpretation of Egyptian religious history, my Hellenic model does not fit the Egyptian facts as closely as it would fit them if Breasted's account of them still held the field.

In analysing my Hellenic model I isolated two further elements. One of these was the barbarians, with their gift for epic poetry, their taste for adopting higher religions in heretical forms, and their failure to make substantial contributions to the creation of new civilizations. The other element was renaissances. In contrast to the element in our Hellenic model represented by the role of Christianity as the chrysalis of new civilizations, barbarians and renaissances occur frequently in non-Hellenic contexts. I have surveyed their occurrences already,² and therefore need not repeat the operation here.

Bagby has applied his Hellenic and Western pattern of an Age of Faith followed by an Age of Reason to the histories of the other civilizations on his list. His findings³ are that this pattern is plainly visible in early Chinese (in my terminology, 'Sinic') history and is also visible in early Indian ('Indic') history—in this case with a tendency towards over-elaboration, towards the close of the Age of Faith, which comes closer to the Western version of the pattern than to the Hellenic and Sinic versions. He finds traces of the process of rationalization in the histories of the Sumero-Akkadian, Egyptian, Andean, and Middle American civilizations.⁴

It will now be evident that the different elements in my Hellenic model are not all of equal service as keys for elucidating uniformities in the configuration of the histories of civilizations. In the cases of four elements out of my five, and of Bagby's further element, the Hellenic pattern is reproduced both closely and frequently. For instance, the process of rationalization indisputably occurred in the histories of the Western, Sinic, Andean, and Middle American civilizations. Renaissances on the pattern of the renaissances of Hellenism in the Western and Byzantine worlds indisputably occurred in the later phases of the history of civilization in China, India, the Tigris-Euphrates basin, and Egypt, whether we interpret these later phases as being the histories of separate civilizations or whether we interpret them as being merely a

¹ This change of view among Egyptologists has been noticed already on p. 95, footnote 1. Breasted's view, as reproduced by me, is criticized by L. Thorndike in *The Journal of Modern History*, vol. vii, No. 3 (September, 1935), pp. 315-17, and by H. Frankfort in *The Birth of Civilization in the Near East*, p. 27.

² For barbarians, see v. 194-337 and viii. 1-87; for renaissances, see ix. 1-166.

³ See *Culture and History*, p. 212.

⁴ I agree with these findings, and the correspondences seem to be both close and numerous enough to warrant our regarding this pattern as being one of the established uniformities in the configuration of the histories of civilizations. Bagby finds the same pattern in the history of his 'Near Eastern' (i.e. Spengler's 'Magian') Civilization. He sees here an age of faith in the first five centuries of the Christian Era, marked by Early Christianity, Neoplatonism, and the phases of Judaism and of Zoroastrianism that find their respective expressions in the Talmud and the Zend. His age of reason in this case is ushered in by the epiphany of Islam, whose role he equates with Protestant Christianity's in Western history, and it comes to maturity with the Islamic World's reception of Hellenic science and philosophy. Evidently there is something to be said for this interpretation. But, if we accept it, we shall have, on the analogy of it, to distinguish an age of faith and a subsequent age of reason within the medieval age of Western history, though this, as Bagby sees it, is all one age of faith. The reception of Aristotle in the medieval West was no less, and no more, a triumph of reason than the previous reception of him in Dār-al-Islām.

continuation of the preceding phase in each case. Barbarians break out in other times of trouble besides the Hellenic and break through the frontiers of other universal states besides the Roman Empire. The political configuration of our Hellenic model recurs, as we have already reckoned, in the histories of at least nine other civilizations.¹ On the other hand, this element in our Hellenic model entirely fails, as we have seen, to fit the political history of the Egyptiac World. The configuration of Egyptiac political history is not only different; it is antithetical. In Hellenic history the universal state is the last phase; in Egyptiac history it is the first. And, when we come to the procreation of affiliated civilizations through the agency of a higher religion serving as a chrysalis, we find our Hellenic model failing to provide a key more often than it succeeds.² This element in the model does recur, as we have seen, in Chinese and Indian history, and perhaps in Egyptiac history too; but, in each of these other instances, the break in continuity does not seem decisive enough to entitle me to confirm my provisional interpretation of what comes after the break as being the history of a new civilization.

4. A CHINESE ALTERNATIVE MODEL FOR CIVILIZATIONS

We have now carried out our re-examination of the applicability of the Hellenic model as a key to the interpretation of the histories of other civilizations; and, as a result, the use of this model in previous volumes of this book has, I should say, vindicated itself. The Hellenic model evidently does throw considerable light on the historical structure of civilizations as a species; and the results of the re-examination indicate, it seems to me, that I have not gone astray in employing the model up to its full capacity. I have, however, I should now say, been at fault in having been content, up to this point, to operate with the Hellenic model only. Though this particular key has opened many doors, it has not proved omniscient. We have seen, for example, that it has not opened the door to an understanding of the structure of Egyptiac history. This and other cases in which it has proved not to fit ought to have made me aware of its limitations and to have led me, not to lose confidence in the results obtained with this key, as far as these results go, but to try other keys as well.³ 'The paranoiac or monomaniac has to fit all phenomena to a pet idea.'⁴ I do not want to cast myself for this self-defeating role. Perhaps I can avoid it if I take to heart two pieces of good advice that have been offered to me by W. Kaufmann.⁵ He warns me to pay attention to evidence that appears to contradict my theories, and to test my theories, where the evidence does seem to me to bear them

¹ See p. 173.

² T. A. Sumberg questions 'whether churches are universally the link between the death and birth of related civilizations' (*Social Research*, vol. 14, No. 3 (September, 1947), pp. 267-84).

³ This point has been taken by the Rev. E. R. Hardy Jr. 'One wonders whether a scholar starting on the same enterprise from a Chinese or Indian, or even an Islamic, perspective might not have made something quite different and equally true' (*The Intent of Toynbee's History: A Cooperative Appraisal*).

⁴ A. L. Kroeber: *The Nature of Culture*, pp. 81-82.

⁵ In Toynbee and History, p. 211. Cp. R. L. Shinn: *Christianity and the Problem of History*, p. 15.

out, by considering whether the same evidence may not also bear out alternative constructions.¹ I will also recall a maxim of Cohen's that I have quoted already in a different context.²

"The safeguard against bias is . . . to explore one's preconceptions, to make them explicit, to consider their alternatives, and thus to multiply the number of hypotheses available for the apprehension of historical significance."³

Acting on these counsels in the present case means mounting other models besides the Hellenic-Byzantine-Western model and seeing what results we obtain by applying these, in turn, to the same body of evidence. Theoretically the Egyptian model might be the most illuminating, since the Egyptian Civilization is apparently the most recalcitrant of all to attempts to interpret its history in Hellenic terms. This choice, however, would have a practical drawback. The Egyptian culture became extinct as long ago as the fourth or fifth century of the Christian Era. An observer looking at history from the Egyptian standpoint would therefore not be in a position to take into account the fifteen or sixteen hundred years that have elapsed since then. It is true that he would have more than double that length of time to survey in looking backwards from the evening of the Egyptian Civilization to its dawn. All the same, his historical horizon would be a restricted one by comparison with the horizon of a present-day observer's field of vision. This tells in favour of retaining a present-day standpoint; and, if we are to shift our ground from a Western present-day standpoint to some other, a Chinese present-day standpoint is perhaps the most promising for our purpose.

Let me suppose, for instance, that China, not England, had been my own birthplace in A.D. 1889. I should then have had the Confucian equivalent of an Hellenic classical education. After having prepared myself to sit for the civil service examination, I should probably have been just too late to try my fortune before the abolition of this 1,300-years-old institution in A.D. 1905. But I should already have been drilled in the classics so thoroughly that they would have governed my outlook ever since, whatever might have been my experience since the Revolution of A.D. 1911. My picture of world history would, in fact, have been determined by my picture of Chinese history, and I should have seen Chinese history through the eyes of the first oecumenical Chinese historian, Ssu-ma Ch'ien (*vivebat circa* 145 B.C.-90 B.C.) and his continuators the compilers of the successive dynastic histories.

Looking at current events and the long vista of their antecedents through these classically trained eyes, I should not have been taken by surprise when, in 1911, the unitary regime of the Ch'ing (Manchu) dynasty, under which China had been living by then for more than a quarter of a millennium, dissolved into anarchy, nor again when, in 1948-9, this bout of anarchy was brought to an end by the establishment of another unitary regime. Both these revolutionary events would have

¹ Cp. Sir Llewellyn Woodward's observations quoted on p. 168.

² See p. 60, footnote 2.

³ M. R. Cohen: *The Meaning of Human History*, p. 80. Cp. p. 115.

conformed to the age-old pattern of Chinese history as this had been presented by Ssu-ma Ch'ien and his successors. In their view, which would consequently have been my view, Chinese history had run in a rhythmical series of alternations between bouts of unity and order and bouts of disunity and anarchy. No bout of either kind had ever come to stay; and it could be predicted with confidence that halcyon days would give way to rough weather, and that the roughest weather would give way in its turn, sooner or later, to halcyon days. These predictions could be made by induction from a canonical record that, by A.D. 1911, extended over a span of not much less than five thousand years.¹ An empirical verification of this alternating rhythm in Chinese history would, however, have seemed superfluous to a classically educated mind. The rhythm's presence here—and everywhere—was guaranteed by the fact that it was the fundamental rhythm of the Universe: the perpetual alternation of a Yin state of quiescence with a Yang burst of activity.² In the view of the Chinese *Weltanschauung*, the course of non-human nature and the course of human affairs are akin to each other not merely in the general sense that either realm is subject to a set of laws. Their relation to each other is, on this view, much more intimate than that. An identical set of laws governs them both and thereby gears them together.³

Looking at history with these Chinese eyes in the nineteen-twenties, when I was making my notes for this book, I should, of course, have taken Chinese, not Hellenic, history as my model, and I should have seen Chinese history as a series of successive realizations of the ideal of a universal state, punctuated by intermediate lapses into disunion and disorder. The phases of both kinds had varied considerably in length, so that, in the field of human history, the Yin-Yang rhythm would be cyclical without having any regular periodicity. The succession of unitary phases ran back from the Ch'ing (Manchu) regime, under which I had been born,⁴ to the Ming and the Yüan (Mongol), with intervening bouts of disunion that had been relatively brief. The pre-Yüan bout of disunion had lasted for about 150 years; the preceding unitary Sung regime for 167 years; the bout of disunion before that for about half a century; the unitary T'ang regime, with its Sui overture, for more than three centuries before that; the preceding bout of disunion for about four centuries (reckoning back, beyond the collapse of the United Chin

¹ The canon of Chinese history established by Ssu-ma Ch'ien purported to trace the origins of Chinese Civilization back to the early centuries of the third millennium B.C. Recent archaeological research traces these origins back no farther than the thirteenth century B.C., if they are to be equated with the transition, in China, to the Bronze Age from the Neolithic Age.

² This point has been taken by the Rev. E. R. Hardy Jr. 'Perhaps . . . the Hindu or Buddhist view of world-cycles is a truer picture of what Indian or Chinese history feels like to the Indian or Chinese observer than our Western and Christian picture of successive stages leading to a definite end' (*The Intent of Toynbee's History: A Cooperative Appraisal*).

³ Compare the view that became current in the Sumero-Akkadian World at least as early as the eighth century B.C. (see pp. 33-34).

⁴ According to the classical Chinese doctrine, I had been born under it wherever my birth-place happened to be, since all the kingdoms of the Earth were satellites of the Middle Kingdom, even if their rulers were unwilling to acknowledge this political verity, or were blankly ignorant of it.

(Tsin), to the collapse of the Posterior Han); the unitary Han regime, with its Ch'in (Ts'in) overture, for about four centuries before that, punctuated by two sharp but short bouts of anarchy in A.D. 9-25 and 207 B.C.-2 B.C.

From the fall of the Ch'ing unitary regime in A.D. 1911 back to the establishment of the Ch'in (Ts'in) unitary regime in 221 B.C., the traditional model of Chinese history corresponds to the historical facts. But, as A. F. Wright has pointed out,¹ this model is a myth created and propagated by the Confucian litterati. They have glozed over cracks, deviations, and tensions, and have ignored radical Chinese critics of the Chinese way of life. 'The result is a self-image of the civilization which has a deceptive symmetry, a self-consistency that belongs to its myth and not to its history.'² According to this myth, 'the history of China' has been 'the record of men striving to realise the ideals of the sages'.³ Simplified images tend to harden from hypotheses into articles of faith,⁴ and Chinese traditionalists have cajoled themselves into giving credence to a presentation of the Pre-Han history of China which bears little resemblance to the reality.

We have noticed⁵ that, from the Han Age inclusive back to the dawn of the Sinic Civilization, the configuration of Chinese history conforms to the Hellenic model. At the earliest date at which the record of Chinese history comes into clear focus—and this is no earlier than the ninth or eighth century B.C.—China makes her appearance on the scene as a politically disunited world of local states, and the political unity that she eventually attained under the Ch'in (Ts'in) and Han dynasties was the consequence of a long-drawn-out series of ever more devastating interstate wars. Throughout the age preceding the political unification of 221 B.C., China was, however, already a unity on the cultural plane; and on this plane her greatest intellectual creative work was done during the politically catastrophic period of the Contending States, before her political unity was achieved. This was the age of the founders of almost all the schools of Chinese philosophy, including Confucius himself, whose school was eventually canonized as the classical one. Confucius was a conservative. He never dreamed of an effective political unification of the Chinese World. Ch'in Shih Hwang-ti's work would have shocked him; and Han Liu P'ang's modification of it would have pleased him hardly any better. Confucius, like Plato and Aristotle, took political disunity for granted. This authentic configuration of early Chinese history—including the contemporaneity of political disunity and intellectual achievement—bears an unmistakable resemblance to the configuration of early Hellenic history, and differs entirely from the pattern of subsequent Chinese history that has been taken by Chinese scholars since the Han Age as their model for Chinese history as a whole. Consequently, this model could not be applied to early Chinese history

¹ In a paper on 'The Study of Chinese Civilization', presented to the Seminar on the Comparative Study of Civilizations at the Center for Advanced Study in the Behavioral Sciences, Stanford, California, 4th March, 1958, p. 5.

⁵ On p. 173.

without doing violence to the facts; and the scholars did this violence rather than renounce their quest of self-consistency and symmetry.

Having correctly observed that the later unitary regimes were conscious and deliberate restorations of the Ch'in (Ts'in)-Han unitary regime, Chinese scholars assumed that this too must have been a restoration of some earlier regime, and accordingly they extrapolated their series of phases of unity, backwards in time, through a Chou and a Shang and a Hsia restoration of an ideal polity supposedly founded by primordial sages. These sages are perhaps gods reduced to human stature; the Hsia regime is legendary, so far as we know; the Shang and Chou regimes were realities; their historicity is attested by surviving material remains of their cultures, including such instructive contemporary documents as the Shang inscriptions on 'oracle bones'. But there is no evidence to suggest that either the Shang or the Chou regime was a polity of the same order as the Ch'in (Ts'in) and Han regimes and their subsequent avatars.¹ Our only sure evidence for conditions in China in the Shang age is that of the artefacts disinterred by modern archaeologists, and these give us no information about the political structure or the territorial extent of the Shang state. As for the Chou, when the curtain rises on the scene of Chinese history, they are no more than *rois fainéants*, like the Japanese Emperors during the seven centuries preceding the Meiji Restoration. Their political suzerainty over the contending local states was nominal. Their authority may have been greater before their disaster in 771 B.C., when a vassal prince combined with a barbarian war-band to sack their capital city. But it is unlikely that, even at the height of their power, the Chou were the rulers of an effective unitary empire comparable to the regime that was established by Ch'in Shih Hwang-ti in 221 B.C.² *Pace* the traditional presentation of Chinese history, the effective unification that Shih Hwang-ti achieved and that Liu P'ang salvaged must in truth have been an unprecedented achievement, as the work of Caesar and Augustus was in the Hellenic World.

The traditional presentation of Chinese history would have been impressed upon the mind of a Confucian-educated Chinese scholar born in 1889; and, if, having been born too late to sit for the last of the civil service examinations, he had made his way to one of the new American universities in China and had widened his historical horizon by adding some Western knowledge to his Chinese stock, probably he would still have applied the traditional Chinese model of the course of history in taking his bearings in his extended field of inquiry.

¹ This point has been made on p. 175, footnote 1. Bagby takes the same negative view of them (*Culture and History*, p. 219).

² In this point the early history of Japan perhaps comes nearer than the early history of China comes to fitting the traditional Chinese model. From the reorganization of the Japanese imperial regime in A.D. 645, on the pattern of the contemporary T'ang imperial regime in China, down to the triumph of feudalism over the imperial administration in the twelfth century, the Japanese imperial government does seem to have exercised some degree of effective power—though, no doubt, this was a wasting asset and was never anything like so effective as the Tokugawa regime and its successors have been. In copying the contemporary T'ang, the Japanese imperial government was modelling itself on a centralizing regime in contemporary China that certainly worked effectively in its earlier stages. There is no evidence that the Chou dynasty of China in its first phase had any similar model to serve it as a standard.

If he had begun by applying the traditional Chinese model to Egyptiac history, the result would have encouraged him to persevere; for the Chinese model fits the facts of Egyptiac history from beginning to end. In the Egyptiac Old Kingdom we have, at the dawn of history, a unitary regime which is neither legendary like the Hsia nor shadowy like the Chou, but is authentic and substantial. And, from that first beat of the Yin-Yang rhythm in the Old Kingdom, this rhythm marches on through the First Intermediate Period of Egyptiac history, the Middle Empire, the Second Intermediate Period, the New Empire, and a series of revivals of the New Empire in which, as in the corresponding stage of Chinese history, the empire-builders' role comes to be filled more and more frequently by foreigners—in the Egyptiac case, Libyans, Ethiopians, Assyrians, Persians, Macedonians, Romans—with indigenous dynasties putting in an appearance more and more rarely.

If our imaginary Chinese inquirer had turned his attention to the Tigris-Euphrates basin next, he would have found himself, to begin with, in a world divided politically among a number of local states, and he would not have been able to detect the expected rhythm till the rise of the dynasty of Agade; but, from that date onwards, he would have been able to trace a rhythmic alternation of political unifications and disruptions over an area that eventually expanded to embrace some of the Tigris-Euphrates basin's hinterlands. The series of unitary regimes here would run from the dynasty of Agade through the Third Dynasty of Ur, the First Dynasty of Babylon, the Assyrian Empire, the Neobabylonian Empire, the Achaemenian Empire, the Seleucid Monarchy, the Parthian Empire, the Sasanian Empire,¹ the Arab Caliphate, the Caliphate's Saljuq successor-state, the Mongol Il-Khanate, the Timurid Empire, the Safawi Empire, and finally the short-lived empire of Nadir Shah, an Afshar Turkish war-lord who was a veritable reincarnation of Naramsin or Tiglath-Pileser III. By Nadir's day the Sumerian language had been extinct for more than three thousand years and the Akkadian for nearly seventeen hundred years, and their cuneiform script had become a riddle of the Sphinx; but the military and political rhythm which the war-lords of Agade had started up had gone rolling on for more than four thousand years.

Turning from the Tigris-Euphrates basin to India, a Chinese student of the morphology of history might fail, at first glance, to detect here any trace of the Sinic pattern. In India, in contrast to the Tigris-Euphrates basin and its Iranian hinterland, the unitary political regimes are echeloned at long intervals down the corridors of time; and, when they make their appearance, they are short-lived. At first glance Indian history may look like a shapeless welter of disorder. Yet four plateaux stand out above the morass—the Maurya, the Gupta, the Mughal, and the British Raj—and these are enough to certify that the Chinese rhythm is in operation in India too, though here the rhythm labours like the engine of a car ploughing its way through a bog.

If our Chinese surveyor now switches to the western end of the Old

¹ The Parthian and Sasanian empires are assigned to a cycle of the history of the Tigris-Euphrates basin by R. Coulborn in *Toynbee and History*, p. 162.

World, he will find himself here in the dilemma that confronted his Chinese predecessors when they had to deal with the age of Chinese history before the unification of China by Ch'in Shih Hwang-ti. Either he must jettison a model derived from the configuration of Chinese history since the epoch-making year 221 B.C., or else he must invent a fictitious history of the pre-Augustan Hellenic World, as Chinese scholarship did invent a fictitious history of the pre-Shih Hwang-ti Sinic World, to fit a pattern to which the authentic configuration of this phase of history cannot be made to conform. A fictitious reconstruction of pre-Augustan Hellenic history on these traditional Chinese lines would have to be made of bricks without straw. The only potential materials would be the brief interlude of unity represented by Philip II of Macedon's League of Corinth, and, before that, a shadowy Minoan and a hardly more substantial Achaean thalassocracy, both of which antedate the dawn of Hellenic history. And, in this reconstruction of early Hellenic history, as in the corresponding reconstruction of early Chinese history, one would have to write off the most signal of the reconstructed civilization's creative intellectual achievements as being by-products of a bout of political disunity which was just one in a series of unfortunate lapses from the normal unitary regime. Evidently the application of the traditional Chinese model would make the same nonsense of early Hellenic history as it makes of early Chinese history.

On the other hand, the model fits well enough if, starting from the Roman Empire, the surveyor moves, not backward, but forward, in time from the year 31 B.C. and keeps his eye fixed on the Empire's central and eastern sections, which were the heart-land of this Hellenic universal state and came to be the seat of the imperial government after its location at Nicomedia by Diocletian in A.D. 284 and at Constantinople by Constantine I in A.D. 324-30. In this heart-land the Yin-Yang rhythm now promptly declares itself. The punctuations of disunity and disorder in A.D. 69 and A.D. 193-7 were repeated and intensified in an agonizing half-century of anarchy running from 235 to 285. The subsequent Diocletianic-Constantinian restoration was followed by a collapse after the imperial army's disastrous defeat by the Goths at Adrianople in 378. But this dangerous reverse, too, was quickly retrieved by a steady recovery in the course of the fifth century. A fresh collapse was brought upon the Hellenic universal state by Justinian I (*imperabat* A.D. 527-65). He overstrained it through his misguided attempt at re-expansion; and this over-exertion was followed by a fresh bout of anarchy, lasting from 602 to 717, which was at least as agonizing, and was twice as long, as the bout in the years 235-85. But in 717 the universal state was restored once more by Leo Syrus; and, after that, unity and order were maintained till 1071; were re-established in 1081; and were maintained again till 1186. The revolt of the Bulgars in that year, and the Western Christians' sack of Constantinople and partition of the East Roman Empire in 1204, precipitated a chaos that lasted for nearly two hundred years. But, in the later decades of the fourteenth century, unity was restored, yet again, by the 'Osmanlis. The new 'Caesar of Rome' (*Qaysar-i-Rum*) re-expanded the restored universal state up to

the limits in South-Eastern Europe and in the Tigris-Euphrates basin that had been attained by the Emperor Trajan (*imperabat* A.D. 98-117); and this Turkish Roman Empire maintained itself for some four hundred years (A.D. 1372-1774), with punctuations of disaster and disorder at the turn of the sixteenth and seventeenth centuries and again after the failure, in 1683, of the second Ottoman siege of Vienna. The defeat of the Ottoman Empire in the Russo-Ottoman war of 1768-74 was the beginning of the end. Yet, even after that, there was a rally in the first half of the nineteenth century. In South-Eastern Europe the Ottoman Empire did not finally break up till 1878, and in South-West Asia not till 1918. The last Ottoman Qaysar-i-Rum was deposed—and the office abolished—by the Emperor's own subjects in A.D. 1922, 116 years after the renunciation of the title of Roman Emperor by the last holder of it in the West.

Here, in an epilogue to Hellenic history which has its starting-point in 31 B.C., we have a counterpart of the pattern of Chinese history since 221 B.C. which is almost as exact a replica of it as the course of Egyptian history is from beginning to end. And in the Levant, as in China, this persistent rhythm does not peter out till a date that, in 1961, was still within living memory. The Hellenic universal state, however, had some backward outlying provinces round the shores of the western basin of the Mediterranean, including Italy and Rome itself, the semi-barbarian city that had been the universal state's political nucleus. To complete our test of the applicability of the Chinese model to the history of the western end of the Old World, we must apply it in the extreme west too; and the experiment will show that here, from A.D. 378 onwards, the Chinese model fails to fit the historical facts as signally as it fails in the Hellenic World as a whole down to 31 B.C. and in China itself down to 221 B.C.

In the West the fifth century of the Christian Era, which was an age of recovery in the central and eastern sections of the Hellenic World, was an age of disintegration that ended, in A.D. 476, in the suppression of the imperial office here and in a nominal reunification of the whole empire under the imperial government at Constantinople. This was mere camouflage for a partition of the western provinces among a number of barbarian successor-states. In the sixth century Justinian—at an excessive cost to the stamina of the universal state's heart-land—turned the Constantinopolitan Government's title into a reality in Italy, part of North-West Africa, and a smaller part of Spain. But this re-expansion of the Hellenic universal state was ephemeral; it was all undone in the course of the two hundred years following Justinian's death in 565; and the West remained disunited and derelict till the later decades of the eighth century, when the Frankish Carolingians restored the empire in the West—as, in the Levant, in the later decades of the fourteenth century, it was restored by the 'Osmanlis.

After the coronation of Charlemagne at Rome on Christmas Day, A.D. 800, the former domain of the Hellenic Civilization harboured two effective states—one centred on Gaul and the other on Anatolia—each of which claimed to be the Hellenic universal state's legitimate

representative. This self-contradictory political situation would not perplex a Chinese scholar. In Chinese history it has at least two counterparts in the coexistence of the barbarian northern empire of the Wei with an indigenous southern empire (the Sung, Ch'i and Liang regimes) from A.D. 439 to A.D. 534, and again in the coexistence of the barbarian northern empire of the Kin, followed by the Mongols, with another indigenous southern empire (the Sung) from 1127 to 1279. In China on each of these occasions, the next phase was the re-establishment of unity as a result of an annexation of the south by the north. This was achieved by the Sui in A.D. 589 and by the Mongols (Yüan) in A.D. 1279. With these precedents in mind, a Chinese scholar, coming fresh to Western history, would wait expectantly for a political reunification of the entire Hellenic World in the ninth century of the Christian Era through a Carolingian conquest of the Constantinopolitan Roman Empire.¹ But in the ninth century, as in the fifth, the history of the West obstinately took an un-Chinese and un-Byzantine course.

So far from annexing Anatolia, the Carolingians lamentably failed to maintain their empire in Gaul. The West now went through another bout of political disunity and barbarian invasion; and, since the formal partition of the Carolingian Empire in 843, the reunification of most of the former western provinces of the Empire, which the Carolingians achieved but failed to maintain, has never been repeated effectively. In the West, from 888 to 962, even the title of Roman Emperor was sometimes in abeyance, and the occasional claimants to it were not in effective control of more than fragments of the whole territory. The Empire was restored again, in conformity with the Chinese pattern of history, in 962, when the Saxon Otto I was crowned Emperor at Rome, and it was once more a political reality from that date till the death of the Emperor Frederick II Hohenstaufen in 1250. But even the nominal suzerainty of this medieval Western Roman Empire was never recognized in France, which was the central and the leading country of the Western World—not to speak of Britain, which had not been incorporated in the Carolingian Roman Empire either—and, throughout the three centuries of its more or less effective existence, the nominal authority of 'the Roman Empire of the German People' was nebulous in Burgundia and was perpetually resisted, *de facto*, in Italy. Even in Germany and Lotharingia it was a wasting asset. After the death of Frederick II the Western Roman Empire was a farce. It is true that the title of Emperor was again held in a continuous succession from 1273 to 1806; but, in so far as its holders, in this phase, had any effective power, they had this in virtue of being also rulers of some local Western state, such as Luxembourg-Bohemia in the fourteenth century and the Hapsburg dominions from 1438 onwards. When the Emperor Francis II Hapsburg renounced the title on 6th August, 1806, he was not parting with any of his previous political power. The real basis of his power, which was that of a local ruler, was proclaimed in the solecism 'Hereditary

¹ The likenesses and differences between the sequel to the fall of the Han Empire in China and the sequel to the fall of the Roman Empire at the western end of the Old World have been discussed in this book in ix. 649-81.

Emperor of Austria'—a title that Francis II had already assumed on 10 August, 1804.

To apply the traditional Chinese model to the history of the West, we should have to take the Western wraith of the Roman Empire as being the key institution of the Western Civilization, and this would be to make nonsense of Western history, not only during the last century and a half, when even the name of the Roman Empire has been extinct on Western soil, but at least as far back as the disintegration of the Carolingian Roman Empire. The Western Roman Empire is not a key to any of the things that are characteristic or significant in Western history.

The Chinese model is equally inapplicable to the histories of the Middle American and Andean civilizations, which the Hellenic model fits so well. In the Andean World there is no evidence that there had ever been political unity before this was established by the Incas, and the Inca universal state had been in existence for only about forty years¹ by the date when it was overthrown by the Spanish *conquistadores*. In Middle America the Aztec Empire had not yet completed the political unification of its world by the date when it met the same fate at the same hands. The Spanish Viceroyalty of New Spain might perhaps be regarded as being the consummation of the Middle American universal state that the Aztecs had been building up, and the Spanish Viceroyalty of Peru as being a continuation of the Inca universal state in the Andean World. But the Spanish Empire of the Indies broke up into successor-states within three hundred years of its establishment, and there is no indication that the present regime in Latin America, in which this region is partitioned among twenty-one local republics, is an 'intermediate period' which is going to end in the re-establishment of political unity there.

Our survey of the histories of civilizations in terms of the traditional Chinese model has shown that this, like the Hellenic, fails to fit all cases. Indeed, its only perfect fit is its application to Egyptian history, and this only on condition that we leave the 'prehistoric' age out of account. The traditional Chinese model does not fit the early history of any other civilization, not even that of civilization in China itself. Paradoxically, it can give only a negative account of the age in which its own revered patron-philosopher Confucius lived, though Confucius was a child of his age, besides being an innovator under the guise of an archaist. The traditional Chinese model has to write the Confucian Age off as part of an intermediate period between the Western Chou and the Imperial Ch'in (Ts'in). From the date of the establishment of a universal state onwards, the Chinese model does fit Hellenic and subsequent Byzantine history well, the history of the Tigris-Euphrates basin and Iran passably, the history of India barely. But it does not fit Western, Middle American, or Andean history at all. And, in a pattern that presents history as an alternation of universal states and lapses from them, and ignores both local states and diasporas, there is no place for the Jews. The Jews lost their local state, never managed (as most other peoples have never managed) to become empire-builders, but have managed

¹ See p. 373.

(unlike most other peoples) to preserve their national identity without having a state or even a national home. In world history seen through Chinese spectacles, the Jews would pass unnoticed both in the age of the Prophets and in the age of the Pharisees.

It will be seen that the shortcomings of the Chinese model are at least as great as those of the Hellenic one. What conclusion are we to draw from this? Shall we jettison both models, and dismiss the policy of operating with models as an unprofitable wild-goose-chase? It seems more reasonable to conclude that the Chinese model, like the Hellenic model, is illuminating as far as it goes, and that the two models, looked at in relation to each other, are more than twice as illuminating as each of them is by itself.

The Chinese model has one clear advantage over the Hellenic, and that is its greater generality. This makes it possible to streamline the pattern of history by getting rid of distinctions, generated by the Hellenic model, that are perhaps artificial and superfluous.

For instance, the Hellenic model—at any rate as I have constructed it—distinguishes between several kinds of universal state. There are straightforward specimens (e.g. the Roman Empire in the Hellenic World and the Ch'in-Han Empire in China); there are rehabilitations after interruptions (e.g. the Gupta Empire figures as a rehabilitation of the Maurya Empire, and the Arab Caliphate as a rehabilitation of the Achaemenian Empire); and there are renaissances, when the universal state of an antecedent civilization is conjured up again in the history of an affiliated civilization (e.g. the T'ang Empire, the Carolingian Empire, and the East Roman Empire as reconstituted by Leo Syrus figure as rehabilitations of the Ch'in-Han Empire and the Roman Empire respectively). When we substitute the Chinese for the Hellenic model, these rather tiresome distinctions disappear, and we can treat on a parity, for purposes of comparative study, all states that embrace the whole geographical domain of a civilization. This simplification of the pattern and increase in the number of the specimens of it is a gain for the cause of knowledge and understanding. Gerhard Masur has criticized my list of universal states as being arbitrary.¹ I do not agree with all the particular points that Masur makes, but, in principle, I plead guilty to his charge; and I attribute my error, not to my having used the Hellenic model, but to my having used it exclusively, without also having used the Chinese model, or some other, as a check and a possible corrective.

The Hellenic model also suggests a distinction between three different kinds of 'intermediate period': a 'time of troubles', such as that which occurred in Hellenic history between the breakdown of the Hellenic Civilization and the establishment of the Roman Empire; a lapse in the maintenance of a universal state, as exemplified in the temporary breakdowns of the Roman Empire in A.D. 69, A.D. 192-7, and A.D. 235-85; and an 'interregnum', such as that which occurred between the fall of the Roman Empire and the rise of the Western and Byzantine successors of the Hellenic Civilization. The Chinese model suggests that these

¹ In the *Historische Zeitschrift*, Band 177 (1954), pp. 521-2.

three kinds of relatively anarchic interlude should all be treated as so many examples of the 'intermediate period' in the alternating Yin-Yang rhythm.¹ This more general way of looking at them may give us insights into their nature; but here we must be on our guard against being led into effacing distinctions that may be significant and important. The 'time of troubles' which the Hellenic model distinguishes from other anarchic interludes in Hellenic history was not, in fact, an intermediate period between two bouts of a universal state. It was the painful period of transition to a regime of political unity from a previous regime of political disunity that had broken down. This sequence—political disunity, breakdown, 'time of troubles', universal state—occurs, as we have seen, in at least nine other instances, including the history of the Sinic Civilization; and even Egyptian history will perhaps be found to conform to the Hellenic pattern if we take the pre-civilizational age of the history of Egypt into account.

5. AN HELLENO-SINIC STANDARD MODEL FOR CIVILIZATIONS

In fact, the Hellenic model is as widely applicable to the earlier phase in the histories of civilization as the Chinese model is to the later phase; and an improved model can be constructed by combining the later phase according to the Sinic model with the earlier phase according to the Hellenic.² This composite model for the histories of civilizations shows these societies starting as unities on the cultural plane without being united on the political plane. This regime is favourable to social and cultural progress; but its price is chronic warfare between the local states; this warfare becomes more intense and more devastating as the society grows in strength; and sooner or later it produces a social breakdown which, after a long-drawn-out 'time of troubles', is belatedly retrieved by the establishment of a universal state. This universal state is subject to recurrent lapses into anarchy; but, whether these intermediate periods are short or long, they are apt to be surmounted by the restoration of political unity. There must be some strong force making for the maintenance and, after lapses, for the restoration of unity, when once the original achievement of unity has come to pass; for the phenomenon of restoration occurs again and again, and this even after 'intermediate periods' that have been so long and so anarchic that they might have been expected to have made an irreparable break in the tradition.

This new model fits a great majority of the indisputable specimens of the species of society that we have called 'civilizations'. The Egyptian Civilization is unique in having achieved political unity at the opening

¹ The label 'time of troubles', which I have applied to the anarchic period of Hellenic history preceding the establishment of the Hellenic universal state, is in fact taken from the traditional Russian name for a lapse in the maintenance of the Russian universal state, i.e. the Muscovite Empire, between the extinction of the House of Rurik and the accession of the Romanovs.

² Sinic history, by itself, offers all the necessary data for constructing the improved model. If Chinese scholars had not done violence to early Chinese history in their excessive zeal for symmetry and self-consistency, it would not have been necessary to resort to an Hellenic model, as we have had to do, in order to correct the traditional Chinese misrepresentation of the configuration of early Chinese history.

of its history; but, as we have observed, there was an antecedent age of political disunity here too, if we take into account the pre-civilizational stage of history in Egypt. The Middle American, Andean, and Hellenic civilizations are exceptional in having experienced only a single spell of the universal-state stage instead of the normal experience of an initial spell followed by a series of restorations. But, in the Hellenic Civilization's case, this is true of the sequel only in the westernmost section of its domain. Western historians are apt to be preoccupied by what happened in these backward outlying territories, because this is the history of their own civilization. But the sequel to the fall of the Roman Empire in its central and eastern provinces is at least as significant; and in this area the sequel conformed to the Chinese pattern: there was a series of revivals of the universal state, beginning in A.D. 717 and not coming to a final close till 1922.

The composite Hellenic-Sinic model, which is evidently the standard pattern, is explicable in human terms in all its stages. For example, when we examine a civilization's age of growth, we shall not be surprised to find that a period in which a society is articulated into a number of politically separate local communities, all sharing one common culture, should be a time of creativity and progress. The stimulus that comes from direct personal intercourse works more powerfully in a small community than in a large one; life in a small community that is in active and competitive intercourse with neighbours of its own size and kind is more stimulating still, since this is a social structure that combines the stimulus of intimacy with the stimulus of a wider horizon. A classic exposition of the cultural advantages of a regime of political disunity within a unitary economic and cultural field has been given by Hume in his essay *Of the Rise and Progress of the Arts and Sciences*.¹ But these blessings have their price in the currency of inter-state warfare; and a point may come when the toll taken by this is greater than any benefit that the stimuli of variety and competition can confer. If the balance becomes decidedly adverse, the society breaks down. It might be asked why a society does not forestall its breakdown, or at any rate retrieve it, by promptly applying the remedy of political unification to which it does eventually have recourse. Why do people put up with a long-drawn-out 'time of troubles' before bringing themselves to get rid of warfare by submitting to a universal state? The answer is that human beings are creatures of habit, and that the regime of local sovereignties has won such a hold on people's hearts in the age when it was producing a balance of advantage that it takes a long experience of its subsequent disastrous effects to induce its former beneficiaries to abandon their allegiance to it when they have become its victims.

When once, however, a universal state has been established, it is not surprising that this regime should win a hold on people's hearts in its turn. The peace and order that the achievement of political unity brings with it are appreciated by contrast with a foregoing 'time of troubles' that had become intolerable before it was transcended; and the loss of stimulus now seems a cheap price to pay for the inestimably precious

¹ This passage has been quoted in the present book in i. 473-4.

boon of being rescued from the jaws of destruction and guaranteed against a recurrence of this fearful threat so long as the universal state lasts.¹ With the passage of time, a universal state's hold over its subjects' hearts is apt to increase, unless the empire-builders have been aliens who have persistently made themselves odious.² It is easy to understand why a universal state, once established, should be restored again and again when it has broken down. But we still have to ask ourselves why, when once it has been established, there should be any 'intermediate periods'³ at all, considering that normally the maintenance of the universal state is desired by at least a majority of its subjects.

In previous volumes the declines and falls of universal states have been interpreted as being the after-effects of mortal wounds that had been inflicted by society on itself during the foregoing 'times of troubles'; and this lassitude, if not exhaustion, would explain the lapse in the maintenance of a universal state; but it would not explain how a society that has lacked the vitality to maintain its universal state can subsequently summon up enough vitality to re-establish it. In seeking to account for the Yin-Yang alternating rhythm that seems normally to prevail in the history of a civilization from the date of the first establishment of its universal state, we need not rest content with the Chinese account of this rhythm as being a manifestation, in human affairs, of a fundamental cosmic rhythm that is itself inexplicable and axiomatic.⁴

¹ H. Frankfort has criticized my previous treatment of Egyptian history on the ground that I have viewed it through Hellenic and Western spectacles and have consequently failed to see it as it really was (*The Birth of Civilization in the Near East*, pp. 27-31). As Frankfort sees it, 'the ideal of a marvellously integrated society had been formed long before the Pyramids were built; it was as nearly realised, when they were built, as any ideal social form can be translated into actuality; and it remained continuously before the eyes of rulers and people alike during subsequent centuries. It was an ideal which ought to thrill a Western historian by its novelty, for it falls entirely outside the experience of Greek or Roman or modern man, although it survives, in an attenuated form, in Africa. It represents a harmony between Man and the divine which is beyond our boldest dreams, since it was maintained by divine power which had taken charge of the affairs of Man in the person of Pharaoh. Society moved in unison with Nature. Justice, which was the social aspect of the cosmic order, pervaded the commonwealth' (ibid., pp. 27-31). Frankfort's thesis that the Egyptians' 'polity was not imposed but evolved from immemorial predilections' (ibid., p. 99) is not, I think, contradicted by anything that I have written in previous volumes of the present book. On the other hand, when Frankfort goes on to say that this polity 'was adhered to, without protest, for almost three thousand years', his contention here is contradicted, not just by me, but by the evidence of the surviving Egyptian literature of the Age of the Middle Empire. This testifies that the ideology of the Old Kingdom regime, and the measures (e.g. pyramid-building) through which this ideology was put into practice, did eventually provoke a moral reaction that went to the length of political revolution in the last days of the Sixth Dynasty.

² This exceptional case is underlined by K. W. Erdmann in *Archiv für Kulturgeschichte*, xxxiii. Band, Heft 2 (1951), pp. 174-250, on pp. 224-5.

³ In a previous passage (p. 55, footnote 3) it has been noticed that a comparative value judgement is implicit in the ostensibly neutral term 'intermediate periods' which has been coined by the Egyptologists but is applicable also to the bouts of disorder and disunity in Chinese and in Byzantine history. The implicit judgement that political unity, embracing the whole domain of a civilization, is the normal, proper, and desirable state of affairs may or may not be objectively justifiable; but there is no doubt that it accurately represents the feelings of populations that have had experience of a universal state or have inherited a tradition of one from their ancestors.

⁴ H. A. L. Fisher has made fun of me for taking the Chinese concept of Yin and Yang seriously. 'In the great operatic performance of humanity he detects', Fisher says of me, 'the occurrence of this *Leitmotive* of Yin and Yang. Other ears will be less sensitive to the regularity of the Chinese beat' (*The Nineteenth Century and After*, December, 1934,

The Yin-Yang rhythm does run through the histories of universal states, but there is a human explanation of it. It is an explanation in economic terms.

A universal state is a heavy charge on the economy of a civilization. It requires, for its maintenance, a well-paid professional civil service and professional defence force; and the cost of these services will rise if it is one of the laws of the history of a universal state that, with the passage of time, the administrative and military personnel is apt to become more numerous as the institutions of local self-government decay and as the pressure of the trans-frontier barbarians increases. If the universal state—and, with it, the society incapsulated in it—is to be able to meet these rising costs without being crushed by them, it must be able to draw upon a commensurately rising productivity; but, in the Age of the Civilizations up to date, the economy has been more or less static most of the time in the greater part of the *Oikoumenê*.

The deliberate application of science to technology in the West is something recent and unprecedented. Even today, when the Industrial Revolution has been in progress for some two hundred years and has spread from Britain, where it originated, to the ends of the Earth, the greater part of the human race is still in the pre-industrial stage. The last economic revolution before this was the enhancement of the productivity of agriculture through water-control, some time before the close of the fourth millennium B.C., which transformed inhospitable swamps and jungles into the cradles of the Sumero-Akkadian and Egyptian civilizations.¹ But only a fraction of the cultivable part of the Earth's surface is capable of being made to give a comparable yield. Moreover, even in the most favourable environments, the technique of agriculture remained virtually static until the beginning of the present application of science to the improvement of crops and livestock; and this, like the present Industrial Revolution, dates back only to eighteenth-century Britain. Thus the normal economic basis of civilization, till a very recent date, has been a static agriculture at a level of productivity that in most places has been not much higher than that attained in Neolithic societies in the Pre-civilizational Age. But a civilization is a much more costly social structure than a Neolithic society is, and its costs are perhaps at their maximum when the civilization is organized politically in a universal state, and when this universal state has been in existence for some time. The inability of a pre-scientific agricultural economy to bear this economic load is evidently one of the causes of the unwished-for collapses by which so many universal states have been overtaken so many times in succession.

The importance of the part played by the economic factor in determining whether a universal state is to collapse or is to survive can be gauged by comparing the respective fortunes of the Roman Empire in its different sections. The western provinces, in which the Empire

p. 672). On this I can only comment: 'They have ears, but they hear not' (Psalm cxxxv. 17). One can, however, be alive to the prevalence of the Yin-Yang rhythm in human affairs without having to renounce all attempt to explain this.

¹ This economic revolution was made possible by an advance, not in the realm of technology, but in the realm of politics (see pp. 338-9).

collapsed in the fifth century of the Christian Era, were relatively backward economically; the central and eastern provinces, in which, in the same century, the Empire survived, were the principal seats of the Hellenic World's industry and trade; and their relative economic strength more than counterbalanced the relative unfavourableness of their strategic position. Though the centre and the east were more directly exposed than the west was to assaults from the Eurasian Nomads of the Great Western Bay of the Steppe, and from the Sasanian power in Iran and 'Iraq, the Empire managed here to hold its own; and, though it did collapse, here too, in the seventh century, it might have continued to survive in these economically stronger sections if, in the sixth century, the Emperor Justinian had not taxed their strength too severely in attempting to reconquer the derelict west. Thereafter, when, in the eighth century, the Hellenic universal state was re-established in the two rival shapes of the East Roman Empire in Anatolia and the Carolingian Roman Empire in Gaul, history repeated itself through the operation of the same economic causes. The Carolingian Empire swiftly collapsed; the East Roman Empire survived, without any further collapse, for three and a half centuries (A.D. 717-1071). The reason for this diversity of fortunes, this time once again, was that Anatolia in this age was economically capable of carrying the load of a universal state, whereas contemporary Transalpine Western Europe was not. It is significant that in the East Roman Empire, during the century immediately preceding the disaster of A.D. 1071, there had been increasing symptoms of social and economic ill-health in the Empire's heart-land, Anatolia.

These are dramatic illustrations of the survival value of economic productivity for a universal state. Yet, hitherto, the rulers of universal states have seldom been alive to this. More often they have been either indifferent to possibilities of technological advance or positively hostile to these, on the reckoning that any technological change is a menace to economic equilibrium and hence also to the social and political stability that the founders of the universal state have established with such difficulty.¹ Certainly the Roman Imperial Government did not ever realize, at any stage of its history, that technology, as exemplified in Hero of Alexandria's invention of a turbine engine, could have solved the Hellenic universal state's intertwined problems of finance and defence. And in the western provinces in the fourth century of the Christian Era, when the Empire was fighting for survival there, no attention was paid to possibilities of dealing with manpower shortage and with defence logistics by mechanization, though a set of projects for this was published in an anonymous memorandum *De Rebus Bellicis*.² In universal states at both ends of the Old World the public authorities seem normally to have confined their action to collecting the land-tax and turning the screw harder on the taxable cultivators or their landlords when agricultural production has declined or public expenses have mounted.

¹ See the story, cited in ix. 613, footnote 2, of an early Roman emperor's reaction to the news of the invention of unbreakable glass.

² *A Roman Reformer and Inventor: De Rebus Bellicis*, ed. and tr. by E. A. Thompson (Oxford 1952, Clarendon Press).

It is significant that, in China, the local state Ch'in (Ts'in), which eventually established a universal state for the first time by overthrowing the last of its competitors in 221 B.C., was also the state which, in the fourth century B.C., had distinguished itself among its competitors by systematically revolutionizing its social and economic structure with a view to increasing the population's productivity and putting the increased product at the government's disposal. But it is also significant that, when this regime was extended to the whole of China by the founder of the universal state, Ch'in Shih Hwang-ti, it provoked vehement opposition. After Shih Hwang-ti's death his regime was quickly overthrown; and both he and the 'Legist' school of philosophers, whose theories had been the inspiration of the Ch'in government's practice, were execrated in the subsequently established Chinese tradition. The school of philosophy that was officially established by the Han Emperor Wu-ti (*imperator* 140 B.C.–87 B.C.), and that maintained its monopoly, off and on, from that time till A.D. 1911, was not the 'Legist' school, but the Confucian. And Confucianism has not been sympathetic towards non-agricultural economic enterprise, though it has understood the value of water-control for agriculture and for communications.

Wu-ti embarked on expensive military operations. He carried the southern border of the Sinic universal state to the 'natural frontier' of the south coast of China, while on the north he tried to subjugate the whole domain of the Hiongnu Nomads on the Eurasian Steppe. In order to meet his consequent heavy expenses, he revived the policy of the 'Legist' school. He put the imperial government into business and at the same time gave scope to non-agricultural private business enterprise.¹ Notwithstanding these efforts to stimulate production, Wu-ti over-taxed his empire's resources and so was perhaps responsible for the decline and fall of the Prior Han regime within the hundred years following the date of his death. But the opposite policy had no happier results. After the restoration of the universal state by the Posterior Han Dynasty, the Confucian landed gentry who staffed the imperial civil service gained the upper hand over the non-agrarian business interests.² And, when the universal state was thus put back on to an almost exclusively agricultural basis, it collapsed and remained in abeyance for four hundred years, save for the short interlude of the United Chin (Tsin) regime.

In China from the time of the Posterior Han dynasty (A.D. 25–220) until the enforced opening of treaty ports to Western economic enterprise in the nineteenth century, agriculture was the economic basis of the Sinic universal state, and the insufficiency of this economic foundation for this political structure was evidently one important cause of the repeated collapses of the Sinic universal state in the course of the intervening centuries. In discussing the most recent of these collapses, that of the Ch'ing (Manchu) dynasty, W. Altree notes³ that, during its tenure of power (A.D. 1644–1911), this dynasty increased the rate of the land-tax 'twenty to thirty times'.

¹ See B. Watson: *Ssu-ma Ch'ien*, pp. 31–33.

² *Ibid.*, pp. 37–38, and A. F. Wright: *Buddhism in Chinese History*, p. 9, cited already on p. 178, footnote 3.

³ In *Toynbee and History*, p. 268.

'If any one reason accounts for the fall of the Ch'ing dynasty, it probably can be found in the mistaken policy of peasant exploitation that wrecked the economy of the country. This agrarian crisis was the issue of a basic contradiction in Chinese society that runs through the whole imperial history of China and far transcends in time Toynbee's Far Eastern Civilization. The Chinese administration, requiring intricate scribal techniques, depended upon scholar bureaucrats for effectiveness. These administrators were drawn from the wealthy landlord class which alone had the leisure to acquire the necessary academic preparation. Thus the government and its officials both competed through taxes or rents to preempt the basic form of wealth in the surplus production of the land. The gentry-administrator class used its strategic position in government to evade taxation by shifting it to the peasantry. Beset by the government demanding taxes and the landlords demanding rents, the peasantry was progressively impoverished, rebellion was a logical consequence, and a new regime would initiate this predatory system afresh.'¹

The sufferings inflicted on the peasantry by exploitation were aggravated by the exploiters' technological inefficiency.

'It is almost certainly untrue that, under the old regime, [conservancy works] were maintained so effectively as to prevent recurrent disasters. Both Chinese and European scholars have investigated the history of flood and famine in China. The conclusion suggested by their work is that those catastrophes occurred over large areas at short intervals for several—perhaps many—centuries before the present one; nor should that surprise Professor Toynbee, since elsewhere he assigns the Chinese "breakdown"² to a fairly early date—the last quarter of the ninth century. The most significant fact, indeed, is surely the opposite of that emphasized by him. It is the failure of a great civilization, in spite—or, perhaps, because—of all its brilliant achievements in other fields, to master the problem of taming an unfriendly Nature, which the West, in some other respects so inferior to China, has in recent times largely succeeded in solving. The point is not a trifling one, since it concerns the characteristics of two important cultural types, differing sharply from each other both in their virtues and their limitations.'³

These two passages, taken together, go far towards explaining the successive collapses of universal states, not only in China, but in other regions where they have been erected on the same economic and social

¹ Altree, *ibid.*, pp. 267–8. The cultural, social, and moral antagonism in China between the scholar-gentry and the peasantry had been mitigated by Buddhism, first in the North (see p. 176, footnote 1) and then, after political reunification, in China as a whole. Under the T'ang regime, Buddhism 'worked as a social cement, binding together all classes and races in common beliefs and activities' (A. F. Wright: *Buddhism in Chinese History*, p. 74). Under the subsequent regime, when Confucianism regained the upper hand over Buddhism by appropriating it, the neo-Confucian officials acquired a touch of the Buddhist social conscience; and, on their initiative, the Sung imperial government organized charitable work on the grand scale (*ibid.*, pp. 92–94). But, 'in contrast to the earlier period in which Buddhism, in different forms, had formed a common bond between the two main classes of Chinese society, the modern period saw a striking cleavage between the rational ethic of the élite and the religious ethos of the peasantry' (*ibid.*, p. 97). The Neo-Confucian literati were contemptuous of the Buddhist and Taoist village priests (*ibid.*, p. 103).

² i.e. the breakdown of the post-Sinic 'Far Eastern Civilization' (A. J. T.).

³ R. H. Tawney in *International Affairs*, November, 1939, p. 803.

basis.¹ They explain, for instance, the collapse of the Old Kingdom of Egypt, the fifth-century collapse of the Roman Empire in its western provinces, the ninth-century collapse of the Carolingian avatar of the Roman Empire in the same region, and also the eleventh-century collapse of the Byzantine avatar of the Roman Empire in Anatolia. In all these four cases occurring at the opposite end of the Old World to China, the economic basis of the universal state was almost exclusively agricultural, and the burden on the peasantry of maintaining a universal state—a burden that is heavy even under the best regime—became intolerable when landlords armed with official authority shook off governmental control and added their private exactions to the government's demands. The technological history of the Egyptian Civilization is significant.²

This economic explanation of the recurrent re-establishment and recurrent collapse of a universal state provides a key to the Chinese myth of a 'mandate of Heaven' which is received and subsequently forfeited by one imperial dynasty after another. The mandate is forfeited when the numbers and demands of the dominant minority of the day rise to figures at which the sufferings imposed on the peasantry by this excessive tax on their limited productivity come to outweigh, in their estimation, the blessings of unity and peace which the maintenance of a universal state confers. There is a subsequent mandate to a new dynasty to re-establish the universal state that has been wrecked by the late dynasty's misdemeanours because the sufferings imposed by the return of disunity and disorder are no sooner re-experienced than they reactivate the longing for the blessings attending the maintenance of a universal state. The people's nostalgia is the new empire-builders' opportunity; and these *novi homines* usually succeed, not only in re-establishing the lapsed universal state, but also in maintaining it for a further spell. This initial success of theirs is due to the very fact that they are parvenus. At the beginning of their regime they will be fewer in numbers, more modest in their personal demands, and more energetic and efficient in performing their public services than the epigoni of the preceding dynasty whom they have replaced, and also than their own

¹ Philip Bagby has derided my description of the T'ang Empire as being 'a vampire state' (*Toynbee and History*, p. 105). If there is anything wrong about this description, it is that I have applied it only to the T'ang Empire and not also to every occurrence of a universal state both in China and elsewhere.

² The Egyptian Civilization's outstanding technological achievement was its discovery of how to quarry, transport, and dress huge blocks of masonry, and to build these into monuments of an architecture that was as accurate as it was colossal. On the other hand, this civilization lagged surprisingly in its adoption of several other technological devices that were of greater economic and social importance. The potter's wheel, for instance, was not adopted in Egypt before the age of the Third Dynasty, and then only in an inferior form (V. G. Childe: *What Happened in History*, pp. 86 and 122). Wheeled vehicles were not adopted there till the sixteenth century B.C., when the Egyptians mastered the art of chariotry in order to expel the Hyksos. From the fifth millennium B.C. till after the establishment of the Middle Empire at the close of the third, the Egyptians were content to make their metal tools of unalloyed copper (*ibid.*, pp. 122 and 157), and these copper tools continued to be luxuries. The peasants continued, till the time of the New Empire, to use Neolithic tools for the agricultural operations that were the basis of the whole Egyptian World's economy (*ibid.*, pp. 123 and 157). The bronze that had been introduced no earlier than about 2000 B.C. was not superseded by iron, for general purposes, till about 650 B.C. (*ibid.*, p. 192)—and this was three-quarters of a millennium after the discovery of the art of iron-working somewhere in Anatolia.

future epigoni, who are destined to forfeit Heaven's mandate in their turn.

It is noteworthy that this illuminating Chinese myth reappears in the work of the fourteenth-century Arabic Muslim statesman, jurist, historian, and philosopher Ibn Khaldūn. He had no knowledge of his Chinese confrères' ideas; yet, like them, he saw the pattern of history as an alternating rhythm in which the alternate periods of relative order and disorder were consequences of the successive rises and falls of a series of dynasties. In Ibn Khaldūn's view a dynasty normally brings itself to grief in the fourth generation, reckoning the founder's generation as being the first.¹ Ibn Khaldūn's myth was derived from a knowledge of the history of the Arab Caliphate and its successor-states over a period of some seven centuries ending in his own day. How is it that two different sets of historical data have given rise, independently of each other, to an identical account of how human affairs work? The answer is that there is an identical economic and social thread running through the history of China from 221 B.C. to A.D. 1911 and through the history of the Islamic World from the establishment of the Arab Caliphate in the seventh century of the Christian Era to the time in the fourteenth century when Ibn Khaldūn was writing his *Prolegomena to a History of Mankind*. This identical element is the peasant economy which has been the normal economic basis for political structures of all kinds since the beginning of the Age of the Civilizations.

The foregoing examination of the Yin-Yang alternating rhythm in the histories of universal states will now perhaps enable us to arrive at some general conclusions.

One is that the continuing recurrence of a universal state does not necessarily carry with it a continuance of the particular civilization whose vicissitudes originally brought the universal state into existence. For example, if our Chinese spectacles have not played us false in revealing to us, in the Tigris-Euphrates basin and Iran, a continuing recurrence of the same universal state from the second half of the third millennium B.C. down to the eighteenth century of the Christian Era,² we have here an instance of a universal state persisting through the histories of no less than four different civilizations: the Sumero-Akkadian, in which this one originated; the Syriac, which captured it from the Sumero-Akkadian Civilization while it was embodied in the Achaemenian Empire; the Hellenic Civilization, which captured it from the Syriac Civilization when the Achaemenian Empire was overthrown by Alexander and was replaced in Asia by the Seleucid Monarchy; and finally the Iranic Muslim Civilization, if we are right in assigning to this the Mongol Il-Khanate, the Timurid Empire, the Safawi Empire, and Nadir Shah's.³ Similarly, the universal states of the two pre-Columbian

¹ See Ibn Khaldūn: *The Muqaddimah*, translated from the Arabic by F. Rosenthal (London 1958, Routledge and Kegan Paul, 3 vols.), vol. I, pp. 278-82 (chap. II, section 14) and pp. 343-6 (chap. III, section 12). The cyclic rhythm of political history and the causes of it are the central theme of the whole work.

² See p. 191.

³ The accounts, given in previous volumes of this book, of the structure of Syriac history and the place of Islam in history are reconsidered in the present volume in Chapters XIII and XIV. Here there is a discussion of the cultural affinities of the

American civilizations, which were embodied originally in the Aztec Empire and in the Inca Empire respectively, were carried on, in the Spanish vicerealties of New Spain and Peru, under the auspices of the interloping Western Christian Civilization. Similarly, again, the Roman Empire, which had started life as an Hellenic universal state, was subsequently captured, in the avatars of it in its central and eastern provinces, by two different civilizations: first the Byzantine Christian Civilization that animated the East Roman Empire, and then the Iranic Muslim Civilization to which the Ottoman Turkish rebuilders of the East Roman Empire paid allegiance. This Christian and this Islamic civilization must each be regarded as being separate from the Hellenic; for the advent of Christianity and of Islam did make a decisive break in the history of civilization not only in the West but wherever it occurred. The breach of cultural continuity here is unmistakable, even though it may not be warrantable to assume, on this analogy, that comparable breaches of continuity were made in the history of Eastern Asia by the advent of the Mahayana and in India by the emergence of post-Buddhaic Hinduism there.

In the history of civilization in India, and in its history in China as well, the institution making for continuity has not been the recurring universal state. In India this has recurred only rarely and at long intervals. In both sub-continent the thread of continuity has been provided by the persistence of a dominant social class: the Brahman caste in India and the Confucian-educated gentry in China. In China from the turn of the second and the last centuries B.C. till A.D. 1911, the repeated restorations of the universal state were made possible by the scholar-gentry's survival as a source of recruitment for the civil service. But in 1911 the 2,000-years-long innings of this class came to an end; and, when, after a 38-years-long bout of disunity and disorder, the universal state was re-established according to precedent, it resumed its sway this time under non-Confucian auspices. In China Confucianism has now been replaced by Communism, and China has been converted from her traditional indigenous civilization to an exotic one inspired by a philosophy of Jewish-Christian origin that was incubated in nineteenth-century Western Europe.¹ Yet the momentum of the Chinese universal state is not yet exhausted.

We can also see that the series of alternating collapses and restorations of a universal state is not interminable. All known universal states have had a starting-point in a revolutionary change from a previous regime of political disunity. This can be seen to be true of the Chinese universal state, if we look at early Chinese history as it actually was, and not as it has been depicted in the traditional legendary misrepresentation of it. It can also be seen to be probably true of the Egyptian universal state, if we take into account the antecedent course of history in Egypt in its Parthian and Sasanian empires and the Arab Caliphate, which intervened chronologically between the Seleucid Empire and the Mongol Il-Khanate.

¹ J. Madaule judges that I have underestimated the importance of the Communist revolution of 1948 in China (*Diogenes*, No. 13 (Spring, 1956), p. 43). If I have made this mistake, I take the present opportunity of correcting it. I expect that this revolution will prove to have been an epoch-making event, not only for China but for the whole World.

pre-civilizational stage. In China the universal state is still a going concern under a Communist regime. But, in most of the other regions where a universal state has made its appearance and has passed through the same characteristic series of collapses and restorations, it has now come to an end. The Ottoman Roman Empire expired, as we have seen, in 1922; the shadowy Western Roman Empire in 1806; the Spanish Empire of the Indies in the first quarter of the nineteenth century; the 'Iraqi-Iranian universal state in 1747, if we may take the date of Nadir Shah's death as marking its demise; the Indian universal state expired in 1947, when the British Raj in India was replaced by three successor-states.¹ The Egyptiac universal state expired unobtrusively in the third century of the Christian Era, when the Roman emperors changed the religious and constitutional basis of their dominion over Egypt. In the time of the principate they had ruled Egypt, like the Ptolemies and the Achaemenids before them, in the guise of Pharaohs who were sons of Re and gods incarnate. From the reign of Aurelian onwards, they ruled, no longer as gods in their own persons, but as vicegerents of a god who was lord of the whole Universe. If we may take this as being the date of the expiry of the Egyptiac universal state, this has been extinct, by now, for nearly seventeen hundred years. No doubt it is theoretically possible that both it and other representatives of this species of polity might revive again. But the evidence up to date suggests that immortality is not one of the specific properties of universal states. Though they run to longevity, and have frequently had more than a cat's proverbial nine lives, all but two or three of those representatives of the species that have made their appearance hitherto are now extinct, so far as we can tell. The only indisputably extant specimens are the Chinese and the Russian,²

¹ The Indian Union, Pakistan and Burma. Ceylon has derived its civilization from India, and, in the last stage of its political history before it attained its present independence, it shared with India the experience of being under British rule. But Ceylon was not included either in the British Indian Empire or in that empire's Mughal, Gupta, and Maurya predecessors.

² In previous volumes of this book I have taken the Far Eastern Civilization in Japan as being an offshoot of the main body, and have seen its history as following an independent course of its own. I identified the breakdown of the Far Eastern Civilization in Japan with the victory of feudalism over the imperial regime in the twelfth century of the Christian Era, and I found its universal state in the Tokugawa Shogunate.

P. L. Ralph has pronounced (in the *Saturday Review*, 16th October, 1954, p. 19) that 'to characterise the Tokugawa Shogunate as the "universal state" of the Japanese branch of the Far Eastern Civilization is to push an abstraction to the point of fantasy'. The same criticism is made by M. S. Bates (in *Christianity and Crisis*, vol. 15, No. 4 (21st March, 1955), pp. 27-30 and 32). The equation of the Japanese Isles with the World might indeed appear to be a geographical absurdity. Yet every *soi-disant* universal state that has come and gone so far has fallen very far short of being literally world-wide. The universality of a universal state has, so far, been something subjective. It has been a state which, in the eyes of its inhabitants, has embraced the whole of the civilized world that has been within their ken. On this test, the Hellenic, Indian, and Chinese universal states unquestionably pass muster. The Tokugawa polity's claim to qualify for the title is, I agree, more disputable; for, throughout the Tokugawa period, Japan continued to live on cultural capital previously imported from China or via China: e.g. the Chinese characters, Confucianism, Buddhism. Yet the Tokugawa regime did succeed in stopping the importation of any fresh elements of culture from China—in contrast to what had happened in all previous phases of the Far Eastern Civilization in Japan, when a series of Chinese styles of art and schools of Buddhism or of indigenous Chinese philosophy had successively been imported into Japan and been eagerly cultivated there. It was difficult to seal off a group of islands that was so close to the Continent, and equally difficult to make the population of so small a region feel themselves to be culturally self-sufficient. Yet that was the Tokugawa regime's aim. The severity

each of which has achieved its current avatar under the auspices of Communism.

If, however, we have been right in our economic diagnosis of the cause of the recurrent collapse of those universal states that have come and gone up to date, it would seem to follow that the recent change in mankind's economic situation, thanks to the modern Western Industrial Revolution, will have brought with it a change in the prospects of a future universal state—even if this were to differ from all its predecessors in being literally world-wide. It is true that a considerable majority of the human race is still living in the insufficiently productive Pre-industrial Age. It is also true that, in the present stage of human affairs, the cost of a literally world-wide universal state would be high. For, although an all-inclusive society would be relieved of the cost of frontier defence against outer barbarians, besides being relieved of the cost of the competition in armaments between local states, this saving would be more than offset by the cost of helping the economically backward majority of mankind to approximate towards the prosperous minority's standard of living. The present disparity has, at the least, to be drastically reduced if the human race is to live together as a single family; and the cost of this will be enormous, if we aim at the goal of bringing within the reach of every family in the World the material facilities and spiritual opportunities that a Western middle-class family already enjoys.

This is, in itself, a larger economic undertaking than any that has confronted any universal state in the past; and the economic aspect of the problem is not so formidable as its social and religious aspects. Modern technology is advancing so fast, and is spreading so rapidly from its Western originators to the rest of the human race, that the increase in mankind's productivity seems likely to go to formerly unimaginable lengths. The crucial question is whether the still poverty-stricken majority of the human race will be able and willing to make a revolutionary change in its habits and outlook that has already been made by the now relatively prosperous minority. In a society in which public hygiene has been achieving sensational progressive reductions in the death-rate, a reduction in the birth-rate on a corresponding scale is required if technology's potential gift of a higher standard of living,

of the measures that it took for achieving it testifies to the regime's determination to succeed, as well as to the difficulty of the undertaking.

On reconsideration, I think it would be nearer the truth to classify the Tokugawa regime as an attempt at a universal state which failed. It was defeated from within. Japanese inquirers were secretly studying Western science, at the risk of their lives, two generations before Commodore Perry's squadron made its first appearance in Yedo Bay. M. E. Cameron makes a telling point against my previous presentation of Japanese history when she says that my 'estimate of the significance of a universal state implies that it was moribund, yet he recognises that the intelligent and efficient response of the Japanese ruling class to the challenge of Western imperialism hardly seems to be the act of a dead or dying society' (*The Far Eastern Quarterly*, vol. 1, No. 2 (February, 1942), pp. 150-60). This response was, indeed, the measure of the failure of the Tokugawas' attempt to 'freeze' Japanese life.

Yet, if the Tokugawas failed in the end to make a closed world of Japan, they do seem to have succeeded in making a political unity of her. The liquidation of the Tokugawa regime did not bring with it a return of the previous disunity and disorder. The only civil war in Japan since then has been the conflict between the Meiji regime and the Satsuma insurgents in 1877; and, since the defeat of this dissident movement, the maintenance of unity seems to have been taken as a matter of course.

spiritual as well as material, is not to be swallowed up by a sensational increase in the number of mouths to be fed. Hitherto the majority of mankind has, as a matter of course, always multiplied and replenished the Earth up to the limits allowed by its food-supply at a subsistence level only just above the starvation-line. Unless this habit is abandoned, modern technology will have brought with it, for the majority, no increase in well-being, but merely an increase in miserable numbers. On the other hand, modern technology accompanied by a deliberate reduction in the birth-rate as well as in the death-rate would give an unheard-of buoyancy to a future world-state's finances. Instead of being constrained to take an intolerable toll from a poor and static peasant economy, a future world-state could afford to subsidize a revolution in the peasantry's traditional Neolithic way of life through a world-wide application of science and technology to peasant agriculture.

If this is indeed the outlook for a future world-state, that is fortunate for the human race. For the same unprecedented scientific and technological progress that has opened up these prospects of higher production has already produced weapons that would turn war into genocide if they were ever to be used. And the possibility that they may be used will remain open so long as our present-day world remains divided on the political plane, as it now is, among a number of sovereign independent states. In our present situation we can no more afford than our predecessors could, in their 'times of troubles', to let this perilous political disunity continue. But we also cannot afford, in the age of atomic weapons, to let the now imperative political unification of all mankind come about, in the traditional way, through war *à outrance* ending in the destruction of all the competing powers but one. Mankind will have to reach political unity through agreement; and, if and when this unity has once been attained, we shall not be able to afford to see the old alternating rhythm of lapses and recoveries reassert itself. For, in the Atomic Age, any lapse into disunity and disorder would be a threat to the existence of the human race. This is an unprecedentedly difficult problem for statesmanship. But we may take heart if it is true that the technological revolution which has presented this problem to the future architects of a world-state is also going to ease for them the economic problem that has repeatedly worsted their predecessors.

6. A JEWISH ALTERNATIVE MODEL FOR CIVILIZATIONS

The comparative study of civilizations evidently stands to benefit by our new departure of setting up a second model and combining it with the first. Between them the Hellenic and the Chinese model throw light on the configuration of the histories of civilizations which could not have been obtained from either of them applied in isolation. Our new composite model seems to fit the majority of our specimens and to give us new insight into their structure. This success will encourage us to set up a third model, with a view to exploring a phenomenon which our Hellenic-Sinic model does not illuminate.

When a number of mutually independent local communities have lost

their former political identities through being merged in a universal state, the merger has usually been complete and lasting. Even in those exceptional cases in which the duration of the universal state has been confined to a single spell, the short-lived universal state's local successor-states have usually had no continuity with the local states out of which the universal state was originally constituted. The Teutonic and Arab principalities among which the Roman Empire's former Western provinces were carved up were not revivals of the local states, occupying the same region, that the Romans had previously conquered and annexed.¹ The Hispano-American republics among which the former Spanish Empire of the Indies was carved up in the early nineteenth century were not revivals of the local states that had been conquered and annexed by the Aztecs and by the Incas. In China, where Ch'in Shih Hwang-ti's universal state fell to pieces again only fourteen years after its establishment, the attempt to revive the former local states was abortive. Within five years the universal state had been re-established by Han Liu P'ang; and, though this second founder felt it politic to allow some local states, labelled with traditional names, to retain a limited autonomy within his unitary political framework, both their prerogatives and their territories were progressively reduced until they had been completely *gleichgeschaltet* within less than a hundred years after Liu P'ang's accession. The local states into which China broke up again politically in the subsequent successive 'intermediate periods' were new growths, though some of these, too, assumed traditional names in the hope that these might give them an aura of legitimacy. In the history of the Achaemenian Empire it was the same story. The house of the founder, Cyrus II, was patently extinct after the assassination of the Smerdis who claimed to be—and perhaps truly was—this house's last surviving representative. This dramatic event occurred only about twenty-eight years after Cyrus had first set out on his career of conquest, and it was taken as a signal for the re-establishment of the local states that Cyrus had overthrown. But all these local insurrections were overcome by Darius I in little more than twelve months; and, when, 190 years later, the Achaemenian Empire was overthrown by Alexander, only one of the successor-states into which it was subsequently carved up by Alexander's officers had any continuity with a local state that had been in existence before the Persian conquests.²

Thus normally the establishment of a universal state, even for no longer than a single spell, has resulted in a permanent obliteration of the identities of the local states and peoples that have been incorporated in it. A classic case is that of 'the Lost Ten Tribes'. Today the population

¹ The names of the Post-Roman Jutish Kingdom of Kent and Anglian Kingdom of Bernicia may have been reminiscences of the two Pre-Roman Celtic kingdoms of the Cantii and the Brigantes, but there was no continuity here in substance. There was at least a partial change in the composition of the population, and there was a total change of language.

² This exception was, of course, the Ptolemaic Kingdom of Egypt. In the year of insurrections, 522 B.C., Egypt had kept quiet. On the other hand, it had afterwards repeatedly shaken off the Persian yoke in the course of the fifth and fourth centuries B.C. The latest of these spells of Egyptian independence had lasted from 404 to 343/2 B.C., and had thus come to an end only ten years before the restored Persian regime in Egypt was liquidated by Alexander.

of the Kingdom of Israel, which was wiped off the map by the Assyrian Empire in 722 B.C., is represented *in situ* only by a few hundred Samaritans in the neighbourhood of Nāblus. The Israelites who were deported were completely absorbed into the population of the countries in which they were settled. Their loss of identity was not an exception; it was the rule. It has become famous only because the rule was exceptionally broken by the history of the Israelites' kinsmen, the people of Judah, after their local kingdom, in its turn, had been wiped off the map by the Neobabylonian Empire in 586 B.C. The Jews were twice uprooted from their original homeland by Nebuchadnezzar and twice by the Romans. And, before their second uprooting by the Romans in A.D. 135, they had been subjects of five empires in turn: the Neobabylonian, the Achaemenian, the Ptolemaic, the Seleucid, and the Roman. From A.D. 135 to A.D. 1948 there was no such thing as a Jewish state¹ and not even such a thing as a Jewish 'national home' in the sense of a territory that was substantially Jewish in population without being under Jewish rule. Yet, without the political framework of a state or the territorial basis of a home, the Jews have managed to preserve their separate identity, as a people, from 586 B.C.—the year that saw the obliteration of the Kingdom of Judah—down to the present day. They have preserved it as a scattered minority (*diasporá*) living among non-Jewish majorities in countries outside the former frontiers of the extinct Kingdom of Judah and hundreds or thousands of miles away from its historic capital, Jerusalem.

This fact is remarkable and exceptional, but it is not unique.² The Jews are not the only uprooted people who have achieved it. For example, it has also been achieved by the Parsees since the destruction of the Sasanian Persian Empire by the Primitive Muslim Arab conquerors;³ by the Monophysite Christians since the Muslim Arabs' conquest of Syria, Egypt, and Armenia; and by the Nestorian Christians since the fifth century, when they found asylum in the Sasanian Empire from their Orthodox Christian persecutors in the Roman Empire. From the completion of the Ottoman conquest of the former territories of the East Roman Empire down to the revolt of the 'Osmanlis' Greek subjects in the Morea in 1821, the Greek Orthodox Christians were partially uprooted and scattered, yet managed, in *diasporá*, to preserve their identity as a community, Jewish-fashion. In Russian Orthodox Christendom, members of some of the dissenting Christian sects have escaped from their Orthodox persecutors by migrating to the outer fringe of the

¹ During this period, there were states—e.g. the Kingdom of Adiabene and the Khazar Empire—in which the royal family and some of their grandees were converts to Judaism (see the present volume, pp. 85–86). There were also oases in the Hijaz and fastnesses in Abyssinia, the Caucasus, and the Crimea in which converts to Judaism held their own, perhaps with some admixture of Jewish refugees (see ii. 257 and 402–12). But only a minority of the Jews in the World ever lived, or ever could have lived, in these holes and corners.
